### 1.1.4 Definitions

## Frequency converter:

Input:
IvLt,max
The maximum output current.

Ivit,N
The rated output current supplied by the frequency converter.

UvLt, max
The maximum output voltage.

## Control command

Stop the connected motor with LCP and the digital inputs. Functions are divided into two groups.
Functions in group 1 have higher priority than functions in group 2.

| Group 1 | Reset, Coasting stop, Reset and Coasting stop, Quick- <br> stop, DC braking, Stop and the "Off" key. |
| :--- | :--- |
| Group 2 | Start, Pulse start, Reversing, Start reversing, Jog, and <br> Freeze output |

Table 1.2 Control Command

## Motor:

fog
The motor frequency when the jog function is activated (via digital terminals).
$f_{M}$
The motor frequency.
$f_{\text {MAX }}$
The maximum motor frequency.
$f_{\text {MIN }}$
The minimum motor frequency.
$\mathrm{f}_{\mathrm{M}, \mathrm{N}}$
The rated motor frequency (nameplate data).
$I_{M}$
The motor current.
$\mathrm{l}_{\mathrm{M}, \mathrm{N}}$
The rated motor current (nameplate data).
$\mathbf{n}_{\mathrm{M}, \mathrm{N}}$
The rated motor speed (nameplate data).
$\mathrm{P}_{\mathrm{M}, \mathrm{N}}$
The rated motor power (nameplate data).
$\mathrm{T}_{\mathrm{M}, \mathrm{N}}$
The rated torque (motor).
$U_{M}$
The instantaneous motor voltage.
$\mathrm{U}_{\mathrm{M}, \mathrm{N}}$
The rated motor voltage (nameplate data).
ПvLt
The efficiency of the frequency converter is defined as the ratio between the power output and the power input.

## Start-disable command

A stop command belonging to the group 1 control commands - see this group.

## Stop command

See Control Command.

How to Read this Design Gui..

## References:

## Analog Reference

A signal transmitted to the analog inputs 53 or 54 , can be voltage or current.

## Bus Reference

A signal transmitted to the serial communication port (FC port).

## Preset Reference

A defined preset reference from $-100 \%$ to $+100 \%$ of the reference range. Selection of eight preset references via the digital terminals.

## Pulse Reference

A pulse frequency signal transmitted to the digital inputs (terminal 29 or 33 ).

## Refmax

Determines the relationship between the reference input at $100 \%$ full scale value (typically $10 \mathrm{~V}, 20 \mathrm{~mA}$ ) and the resulting reference. The maximum reference value set in 3-03 Maximum Reference.

## Ref $_{\text {min }}$

Determines the relationship between the reference input at $0 \%$ value (typically $0 \mathrm{~V}, 0 \mathrm{~mA}, 4 \mathrm{~mA}$ ) and the resulting reference. The minimum reference value set in 3-02 Minimum Reference.

## Miscellaneous:

## Analog Inputs

The analog inputs are used for controlling various functions of the frequency converter.
There are two types of analog inputs:
Current input, $0-20 \mathrm{~mA}$, and $4-20 \mathrm{~mA}$
Voltage input, 0-10 V DC.

## Analog Outputs

The analog outputs can supply a signal of $0-20 \mathrm{~mA}, 4-20$ mA , or a digital signal.

## Automatic Motor Adaptation, AMA

AMA algorithm determines the electrical parameters for the connected motor at standstill.

## Brake Resistor

The brake resistor is a module capable of absorbing the brake power generated in regenerative braking. This regenerative braking power increases the intermediate circuit voltage and a brake chopper ensures that the power is transmitted to the brake resistor.

## CT Characteristics

Constant torque characteristics used for positive displacement pumps and blowers.

## Digital Inputs

The digital inputs can be used for controlling various functions of the frequency converter.

## Digital Outputs

The drive features two solid-state outputs that can supply a 24 V DC (max. 40 mA ) signal.

DSP
Digital Signal Processor.

## Relay Outputs

The frequency converter features two programmable relay outputs.

ETR
Electronic Thermal Relay is a thermal load calculation based on present load and time. Its purpose is to estimate the motor temperature.

## GLCP

Graphical Local Control Panel (LCP 102)

## Initialising

If initialising is carried out (14-22 Operation Mode), the programmable parameters of the frequency converter return to their default settings.

## Intermittent Duty Cycle

An intermittent duty rating refers to a sequence of duty cycles. Each cycle consists of an on-load and an off-load period. The operation can be either periodic duty or noneperiodic duty.

## LCP

The Local Control Panel (LCP) makes up a complete interface for control and programming of the frequency converter. The control panel is detachable and can be installed up to 3 metres from the frequency converter, for example, in a front panel with the installation kit option. The Local Control Panel is available in two versions:

- Numerical LCP 101 (NLCP)
- Graphical LCP 102 (GLCP)

## Isb

Least significant bit.

## MCM

Short for Mille Circular Mil, an American measuring unit for cable cross-section. 1 MCM $\equiv 0.5067 \mathrm{~mm}^{2}$.
msb
Most significant bit.

## NLCP

Numerical Local Control Panel LCP 101

## On-line/Off-line Parameters

Changes to on-line parameters are activated immediately after the data value is changed. Enter [OK] to activate changes to off-line parameters.

## PID Controller

The PID controller maintains the desired speed, pressure, temperature by adjusting the output frequency to match the varying load.
RCD
Residual Current Device.

## Set-up

Save parameter settings in 4 set-ups. Change between the 4 parameter set-ups and edit one set-up, while another set-up is active.

## SFAVM

Switching pattern called Stator Flux oriented Asynchronous Vector Modulation (14-00 Switching Pattern).

## Slip Compensation

The frequency converter compensates for the motor slip by giving the frequency a supplement that follows the measured motor load keeping the motor speed almost constant.

## Smart Logic Control (SLC)

The SLC is a sequence of user-defined actions executed when the associated user-defined events are evaluated as true by the SLC.

## Thermistor

A temperature-dependent resistor placed where the temperature is monitored (frequency converter or motor).

## Trip

A state entered in fault situations, for example, the frequency converter is subject to an over-temperature or when the frequency converter is protecting the motor process or mechanism. Restart is prevented until the cause of the fault has disappeared and the trip state is cancelled by activating reset or, in some cases, by being programmed to reset automatically. Do not use trip for personal safety.

## Trip Locked

A state entered in fault situations when the frequency converter is protecting itself and requiring physical intervention, for example, the frequency converter is subject to a short circuit on the output. A locked trip can only be cancelled by cutting off mains, removing the cause of the fault, and reconnecting the frequency converter. Restart is prevented until the trip state is cancelled by activating reset or, in some cases, by being programmed to reset automatically. Do not use trip lock for personal safety.

## VT Characteristics

Variable torque characteristics used for pumps and fans.

## VVC ${ }^{+}$

If compared with standard voltage/frequency ratio control, Voltage Vector Control $\left(\mathrm{VVC}^{+}\right)$improves the dynamics and the stability, both when the speed reference is changed and in relation to the load torque.

## $60^{\circ}$ AVM

Switching pattern called $60^{\circ}$ Asynchronous Vector Modulation (14-00 Switching Pattern).

### 1.1.5 Power Factor

The power factor is the relation between $I_{1}$ and $l_{\text {RMs }}$.

Power factor $=\frac{\sqrt{3} \times U \times \Lambda \times \cos \varphi}{\sqrt{3} \times U \times \text { IRMS }}$
The power factor for 3-phase control:

$$
=\frac{h \times \cos \varphi 1}{I_{\text {RMS }}}=\frac{h}{I_{\text {RMS }}} \text { since } \cos \varphi 1=1
$$

The power factor indicates to which extent the frequency converter imposes a load on the mains supply. The lower the power factor, the higher the IRMS for the same kW performance.

IRMS $=\sqrt{P_{1}^{2}+I_{5}^{2}+1_{7}^{2}+\cdots+l_{n}^{2}}$
In addition, a high power factor indicates that the different harmonic currents are low.
The built-in DC coils produce a high power factor, which reduces the imposed load on the mains supply.

Introduction

## 2 Introduction

### 2.1 Safety

## AWARNING

## HIGH VOLTAGE

Frequency converters contain high voltage when connected to AC mains input, DC power supply, or load sharing. Failure to perform installation, start-up, and maintenance by qualified personnel can result in death or serious injury.

- Installation, start-up, and maintenance must be performed by qualified personnel only.

## AWARNING

## DISCHARGE TIME

The frequency converter contains DC-link capacitors, which can remain charged even when the frequency converter is not powered. Failure to wait the specified time after power has been removed before performing service or repair work, can result in death or serious injury.

- Stop motor.
- Disconnect AC mains and remote DC-link power supplies, including battery back-ups, UPS, and DC-link connections to other frequency converters.
- Disconnect or lock PM motor.
- Wait for the capacitors to discharge fully, before performing any service or repair work. The duration of waiting time is specified in Table 2.1.

| Voltage <br> [V] | Power range <br> [kW] | Minimum waiting <br> time <br> (minutes) |
| :---: | :---: | :---: |
| $380-480$ | $110-315$ | 20 |
| $380-480$ | $45-400$ | 20 |
| $525-690$ | $315-1000$ | 40 |
| $525-690$ | $450-1200$ | 30 |
| High voltage can be present even when the warning LED |  |  |
| indicator lights are off. |  |  |

[^0]
## AWARNING <br> LEAKAGE CURRENT HAZARD <br> Leakage currents exceed 3.5 mA . Failure to ground the frequency converter properly can result in death or serious injury.

- Ensure the correct grounding of the equipment by a certified electrical installer.

## AWARNING

## UNINTENDED START

When the frequency converter is connected to AC mains, DC power supply, or load sharing, the motor may start at any time. Unintended start during programming, service or repair work can result in death, serious injury, or property damage. The motor can start by means of an external switch, a serial bus command, an input reference signal from the LCP or LOP, via remote operation using MCT 10 software, or after a cleared fault condition.
To prevent unintended motor start:

- Disconnect the frequency converter from mains.
- Press [Off/Reset] on the LCP, before programming parameters.
- The frequency converter, motor, and any driven equipment must be fully wired and assembled when the frequency converter is connected to AC mains, DC power supply, or load sharing.

## AWARNING

EQUIPMENT HAZARD
Contact with rotating shafts and electrical equipment can result in death or serious injury.

- Ensure that only trained and qualified personnel perform installation, start up, and maintenance.
- Ensure that electrical work conforms to national and local electrical codes.
- Follow the procedures in these operating instructions.

## ACAUTION

## INTERNAL FAILURE HAZARD

An internal failure in the frequency converter can result in serious injury, when the frequency converter is not properly closed.

- Ensure that all safety covers are in place and securely fastened before applying power.

## AWARNING <br> UNINTENDED MOTOR ROTATION WINDMILLING

Unintended rotation of permanent magnet motors can result in serious injury or equipment damage.

- Ensure that permanent magnet motors are blocked to prevent unintended rotation.

### 2.1.1 Disposal Instruction

Do not dispose of equipment containing electrical components together with domestic waste.

Collect it separately in accordance with local and currently valid legislation.

### 2.3 CE Labelling

### 2.3.1 CE Conformity and Labelling

## What is CE Conformity and Labelling?

The purpose of CE labelling is to avoid technical trade obstacles within EFTA and the EU. The EU has introduced the CE label as a simple way of showing whether a product complies with the relevant EU directives. The CE label says nothing about the specifications or quality of
the product. There are three EU directives that regulate frequency converters:

The machinery directive (2006/42/EC)
Frequency converters with integrated safety function are now falling under the Machinery Directive. Danfoss CElabels in accordance with the directive and issues a declaration of conformity upon request. Frequency converters without safety function do not fall under the machinery directive. However, if a frequency converter is supplied for use in a machine, we provide information on safety aspects relating to the frequency converter.

The low-voltage directive (2006/95/EC)
Frequency converters must be CE labelled in accordance with the low-voltage directive of January 1, 1997. The directive applies to all electrical equipment and appliances used in the $50-1000 \mathrm{~V}$ AC and the $75-1500 \mathrm{~V}$ DC voltage ranges. Danfoss CE-labels in accordance with the directive and issues a declaration of conformity upon request.

The EMC directive (2004/108/EC)
EMC is short for electromagnetic compatibility. The presence of electromagnetic compatibility means that the mutual interference between different components/ appliances does not affect the way the appliances work. The EMC directive came into effect January 1, 1996. Danfoss CE-labels in accordance with the directive and issues a declaration of conformity upon request. To carry out EMC-correct installation, see the instructions in this Design Guide. Additionally, find specifications of which standards the Danfoss products comply with. The filters presented in the specifications are part of the product range. Furthermore, Danfoss offers other types of assistance to ensure optimum EMC result.

### 2.3.2 What Is Covered

The EU "Guidelines on the Application of Council Directive 2004/108/EC" outline three typical situations of using a frequency converter. See the following list for EMC coverage and CE labelling.

1. The frequency converter is sold directly to the end consumer, for example, to a DIY market. The end consumer is a layman who installs the frequency converter for use with a household appliance. For such applications, the frequency converter must be CE labelled in accordance with the EMC directive.
2. The frequency converter is sold for installation in a plant designed by trade professionals. The frequency converter and the finished plant do not have to be CE labelled under the EMC directive. However, the unit must comply with the basic EMC requirements of the directive. Compliance is ensured by using components,
appliances, and systems that are CE labelled under the EMC directive.
3. The frequency converter is sold as part of a complete system, such as an air-conditioning system. The entire system must be CE labelled in accordance with the EMC directive. The manufacturer can ensure CE labelling under the EMC directive either by using CE labelled components or by testing the EMC of the system. If the manufacturer chooses to use only CE labelled components, there is no need to test the entire system.

### 2.3.3 Danfoss Frequency Converter and CE Labelling

CE labelling is a positive feature when used for its original purpose, which is to facilitate trade within the EU and EFTA.

CE labelling can cover many different specifications, so check the CE label to ensure that it covers the relevant applications.

Danfoss CE labels the frequency converters in accordance with the low-voltage directive, meaning that if the frequency converter is installed correctly, Danfoss guarantees compliance with the low-voltage directive. Danfoss issues a declaration of conformity that confirms our CE labelling in accordance with the low-voltage directive.

The CE label also applies if following the instructions for EMC-correct installation and filtering.

Detailed instructions for EMC-correct installation are found in. Furthermore, Danfoss specifies which standards our products comply with.

### 2.3.4 Compliance with EMC Directive 2004/108/EC

The primary users of the frequency converter are trade professionals, who use it as a complex component forming part of a larger appliance, system, or installation. The responsibility for the final EMC properties of the appliance, system, or installation rests with the installer. As an aid to the installer, Danfoss has prepared EMC installation guidelines for the power drive system. If the EMC-correct instructions for installation are followed, the standards and test levels stated for power drive systems are complied with. See chapter 2.11 Immunity Requirements.

### 2.4 Air Humidity

The frequency converter has been designed to meet the IEC/EN 60068-2-3 standard, EN 50178 pkt. 9.4.2.2 at $50^{\circ} \mathrm{C}$.

### 2.5 Aggressive Environments

A frequency converter contains many mechanical and electronic components. All are to some extent vulnerable to environmental effects.

## ACAUTION

The frequency converter must not be installed in environments with airborne liquids, particles, or gases capable of affecting and damaging the electronic components. Failure to take the necessary protective measures increases the risk of stoppages, thus reducing the life of the frequency converter.

## Degree of protection as per IEC 60529

The safe stop function can only be installed and operated in a control cabinet with degree of protection IP54 or higher (or equivalent environment) to avoid cross faults and short circuits between terminals, connectors, tracks, and safety-related circuitry caused by foreign objects.

Liquids can be carried through the air and condense in the frequency converter and can cause corrosion of components and metal parts. Steam, oil, and salt water can cause corrosion of components and metal parts. In such environments, use equipment with enclosure rating IP54/ IP55. As an extra protection, coated printed circuit boards can be ordered as an option.

Airborne Particles such as dust can cause mechanical, electrical, or thermal failure in the frequency converter. A typical indicator of excessive levels of airborne particles is dust particles around the frequency converter fan. In dusty environments, use equipment with enclosure rating IP54/ IP55 or a cabinet for IP00/IP20/NEMA 1 equipment.

In environments with high temperatures and humidity, corrosive gases such as sulphur, nitrogen, and chlorine compounds cause chemical processes on the frequency converter components.

Such chemical reactions damage the electronic components quickly. In such environments, mount the equipment in a cabinet with fresh air ventilation, keeping aggressive gases away from the frequency converter. An extra protection in such areas is a coating of the printed circuit boards, which can be ordered as an option.

## NOTICE

Mounting frequency converters in aggressive environments increases the risk of stoppages and considerably reduces the life of the converter.

Before installing the frequency converter, check the ambient air for liquids, particles, and gases by observing existing installations in this environment. Typical indicators of harmful airborne liquids are water or oil on metal parts, or corrosion of metal parts.

Excessive dust particle levels are often found on installation cabinets and existing electrical installations. One indicator of aggressive airborne gases is blackening of copper rails and cable ends on existing installations.
$D$ and $E$ enclosures have a stainless steel back channel option to provide more protection in aggressive environments. Proper ventilation is still required for the internal components of the frequency converter. Contact Danfoss for more information.

### 2.6 Vibration and Shock

The frequency converter has been tested according to the procedure based on the following standards:

The frequency converter complies with requirements that exist for units mounted on the walls and floors of production premises, as well as in panels bolted to walls or floors.

- IEC/EN 60068-2-6: Vibration (sinusoidal) - 1970
- IEC/EN 60068-2-64: Vibration, broad-band random

### 2.7 Safe Torque Off (STO)

STO is an option. To run STO, additional wiring for the frequency converter is required. Refer to $V L T T^{\circledR}$ Frequency Converters Safe Torque Off Operating Instructions for further information.

### 2.8 Frequency Converter Benefits

### 2.8.1 Why use a Frequency Converter for Controlling Fans and Pumps?

A frequency converter takes advantage of the fact that centrifugal fans and pumps follow the laws of proportionality for such fans and pumps. For further information, see the text and Illustration 2.1.

### 2.8.2 The Clear Advantage - Energy Savings

The clear advantage of using a frequency converter for controlling the speed of fans or pumps lies in the electricity savings.
When comparing with alternative control systems and technologies, a frequency converter is the optimum energy control system for controlling fan and pump systems.

Illustration 2.1 Fan Curves (A, B and C) for Reduced Fan Volumes

More than 50\% energy savings can be obtained in typical applications when a frequency converter is used to reduce fan capacity to $60 \%$.

Illustration 2.2 Energy Savings

Introduction

### 2.8.3 Example of Energy Savings

As can be seen in Illustration 2.3, the flow is controlled by changing the RPM. Reducing the speed only $20 \%$ from the rated speed reduces the flow by $20 \%$. This reduction occurs because the flow is directly proportional to the RPM. The consumption of electricity, however, is 50\% lower.
If the system in question must supply a flow that corresponds to $100 \%$ only a few days in a year, while the average is below $80 \%$ of the rated flow for the remainder of the year, the amount of energy saved is even more than 50\%.

### 2.8.4 Example with Varying Flow Over One Year

Illustration 2.4 is calculated based on pump characteristics obtained from a pump datasheet.
The result obtained shows energy savings in excess of 50\% at the given flow distribution over a year. The pay back period depends on the price per kWh and the price of the frequency converter. In this example, it is less than a year when compared with valves and constant speed.

### 2.8.5 Better Control

If a frequency converter is used for controlling the flow or pressure of a system, improved control is obtained.
A frequency converter can vary the speed of the fan or pump, obtaining .
Furthermore, a frequency converter can quickly adapt the speed of the fan or pump to new flow or pressure conditions in the system.
Simple control of process (flow, level, or pressure) utilising the built-in PID control.

### 2.8.6 $\operatorname{Cos} \varphi$ Compensation

Generally speaking, the frequency converter has a $\cos \varphi$ of 1 and provides power factor correction for the $\cos \varphi$ of the motor, which means that there is no need to make allowance for the $\cos \varphi$ of the motor when sizing the power factor correction unit.

### 2.8.7 Star/delta Starter or Soft-starter not required

When larger motors are started, it is necessary in many countries to use equipment that limits the start-up current. In more traditional systems, a star/delta starter or softstarter is widely used. Such motor starters are not required if a frequency converter is used.

As shown in Illustration 2.6, a frequency converter does not consume more than rated current.

Introduction

### 2.9 Control Structures

### 2.9.1 Control Principle

A frequency converter rectifies $A C$ voltage from mains into $D C$ voltage, after which this $D C$ voltage is converted into $A C$ power with a variable amplitude and frequency.

The motor is supplied with variable voltage/current and frequency, which enables infinitely variable speed control of threephased, standard AC motors and permanent magnet synchronous motors.

Illustration 2.7 Control Principle

The control terminals provide for wiring feedback, reference, and other input signals to the following:

- frequency converter
- output of frequency converter status and fault conditions
- relays to operate auxiliary equipment
- serial communication interface

Control terminals are programmable for various functions by selecting parameter options described in the main or quick menus. Most control wiring is customer supplied unless factory ordered. A 24 V DC power supply is also provided for use with the frequency converter control inputs and outputs.

Table 2.7 describes the functions of the control terminals. Many of these terminals have multiple functions determined by parameter settings. Some options provide more terminals. See chapter 5.1 Mechanical Installation for terminal locations.

Introduction

### 2.9.2 Control Structure Open Loop

In the configuration shown in Illustration 2.10, 1-00 Configuration Mode is set to [0] Open loop. The resulting reference from the reference handling system or the local reference is received and fed through the ramp limitation and speed limitation before being sent to the motor control. The maximum frequency allowed limits the output from the motor control.

### 2.9.3 Local (Hand On) and Remote (Auto On) Control

The frequency converter can be operated manually via the LCP or remotely via analog/digital inputs or serial bus. If allowed in 0-40 [Hand on] Key on LCP, 0-41 [Off] Key on LCP, 0-42 [Auto on] Key on LCP, and 0-43 [Reset] Key on LCP, it is possible to start and stop the frequency converter by LCP using the [HandOn] and [Off] keys. Alarms can be reset via the [Reset] key. After pressing the [Hand On] key, the frequency converter goes into Hand Mode and follows (as default) the local reference set by pressing the navigation keys [ $\mathbf{\Delta}$ ] and [ $\mathbf{v}$ ].

After pressing the [Auto On] key, the frequency converter goes into auto mode and follows (as default) the remote reference. In this mode, it is possible to control the frequency converter via the digital inputs and various serial interfaces (RS-485, USB, or an optional fieldbus). See more about starting, stopping, changing ramps and parameter set-ups in parameter group 5-1* Digital Inputs or parameter group 8-5* Serial Communication.

Table 2.8 Conditions for either Local or Remote Reference
Table 2.8 shows under which conditions either the local reference or the remote reference is active. One of them is always active, but both cannot be active at the same time.

Local reference forces the configuration mode to open loop, independent on the setting of 1-00 Configuration Mode.

Local reference is restored at power-down.

Introduction

### 2.9.4 Control Structure Closed Loop

The internal controller allows the frequency converter to become a part of the controlled system. The frequency converter receives a feedback signal from a sensor in the system. It then compares this feedback to a set-point reference value and determines the error, if any, between these two signals. It then adjusts the speed of the motor to correct this error.

For example, consider a pump application in which the speed of a pump is controlled so that the static pressure in a pipe is constant. The desired static pressure value is supplied to the frequency converter as the set-point reference. A static pressure sensor measures the actual static pressure in the pipe and supplies this information to the frequency converter as a feedback signal. If the feedback signal is greater than the set-point reference, the frequency converter slows to reduce the pressure. In a similar way, if the pipe pressure is lower than the set-point reference, the frequency converter speeds up to increase the pressure provided by the pump.

Illustration 2.12 Block Diagram of Closed Loop Controller

While the default values for the closed loop controller often provides satisfactory performance, the control of the system can often be optimised by adjusting some of the parameters of the closed loop controller. It is also possible to autotune the PI constants.

Introduction

### 2.9.5 Feedback Handling

Illustration 2.13 Block Diagram of Feedback Signal Processing

Feedback handling can be configured to work with applications requiring advanced control, such as multiple setpoints and multiple types of feedback. Three types of control are common.

## Single zone, single setpoint

Single Zone Single Setpoint is a basic configuration. Setpoint 1 is added to any other reference (if any, see Reference Handling) and the feedback signal is selected using 20-20 Feedback Function.

## Multi-zone, single setpoint

Multi-Zone Single Setpoint uses two or three feedback sensors but only one setpoint. The feedback can be added, subtracted (only feedback 1 and 2 ) or averaged. In addition, the maximum or minimum value can be used. Setpoint 1 is used exclusively in this configuration.

If [13] Multi-Setpoint Min is selected, the setpoint/feedback pair with the largest difference controls the speed of the frequency converter. [14] Multi-Setpoint Maximum attempts to keep all zones at or below their respective setpoints, while [13] Multi-Setpoint Minattempts to keep all zones at or above their respective setpoints.

## Example:

A two zone, two setpoint application Zone 1 setpoint is 15 bar and the feedback is 5.5 bar. Zone 2 setpoint is 4.4 bar and the feedback is 4.6 bar. If [14] Multi-Setpoint Max is selected, Zone 1 setpoint and feedback are sent to the PID controller, since it has the smaller difference (feedback is higher than setpoint, resulting in a negative difference). If [13] Multi-Setpoint Min is selected, Zone 2 setpoint and feedback is sent to the PID controller, since it has the larger difference (feedback is lower than setpoint, resulting in a positive difference).

### 2.9.6 Feedback Conversion

In some applications it could be useful to convert the feedback signal. One example is using a pressure signal to provide flow feedback. Since the square root of pressure is proportional to flow, the square root of the pressure signal yields a value proportional to the flow. For an example, see Illustration 2.14.

Illustration 2.14 Feedback Conversion

Introduction

### 2.9.7 Reference Handling

## Details for Open Loop and Closed Loop operation.

Illustration 2.15 Block Diagram Showing Remote Reference

The Remote Reference is comprised of:

- Preset references.
- External references (analog inputs, pulse frequency inputs, digital potentiometer inputs, and serial communication bus references).
- The preset relative reference.
- Feedback controlled setpoint.

Up to eight preset references can be programmed in the frequency converter. The active preset reference can be
selected using digital inputs or the serial communications bus. The reference can also be supplied externally, most commonly from an analog input. Select this external source via one of the three reference source parameters (3-15 Reference 1 Source, 3-16 Reference 2 Source and 3-17 Reference 3 Source). Digipot is a digital potentiometer, also commonly called a Speed Up/Speed Down Control or a Floating Point Control. To set it up, one digital input is programmed to increase the reference while another digital input is programmed to decrease the reference. A third digital input can be used to reset the digipot reference. All reference resources and the bus reference

Introduction
are added to produce the total External Reference. The External Reference, the Preset Reference or the sum of the two can be selected to be the active reference. Finally, this reference can by be scaled using 3-14 Preset Relative Reference.

The scaled reference is calculated as follows:
Reference $=X+X \times\left(\frac{Y}{100}\right)$
Where $X$ is the external reference, the preset reference, or the sum of these and Y is 3-14 Preset Relative Reference in [\%].

If Y, 3-14 Preset Relative Reference is set to $0 \%$, the scaling does not affect the reference.

### 2.9.8 Example of Closed Loop PID Control

The following is an example of a Closed Loop Control for a booster pump application:

Illustration 2.16 Closed Loop PID Control

In a water distribution system, the pressure must be maintained at a constant value. The desired pressure (setpoint) is set between 0 and 10 Bar using a $0-10 \mathrm{~V}$ potentiometer or a parameter. The pressure sensor has a range of $0-10$ Bar and uses a two-wire transmitter to
provide a 4-20 mA signal. The output frequency range of the frequency converter is $10-50 \mathrm{~Hz}$.

1. Start/Stop via switch connected between terminals $12(+24 \mathrm{~V})$ and 18.
2. Pressure reference via a potentiometer (0-10 Bar, $0-10 \mathrm{~V}$ ) connected to terminals $50(+10 \mathrm{~V}), 53$ (input) and 55 (common).
3. Pressure feedback via transmitter (0-10 Bar, 4-20 mA ) connected to terminal 54. Switch S202 behind the Local Control Panel set to ON (current input).

Table 2.9 Programming Closed Loop PID

Introduction

### 2.9.10 Tuning the Closed Loop Controller

Once the closed loop controller has been set up, test the performance of the controller. In many cases, its performance is acceptable using the default values of 20-93 PID Proportional Gain and 20-94 PID Integral Time. However, in some cases it is helpful to optimise these parameter values to provide faster system response while still controlling speed overshoot.

### 2.9.11 Manual PID Adjustment

1. Start the motor
2. Set 20-93 PID Proportional Gain to 0.3 and increase it until the feedback signal begins to oscillate. If necessary, start and stop the frequency converter or make step changes in the set-point reference to attempt to cause oscillation. Next reduce the PID Proportional Gain until the feedback signal stabilises. Then reduce the proportional gain by $40-60 \%$.
3. Set 20-94 PID Integral Time to 20 s. and reduce it until the feedback signal begins to oscillate. If necessary, start and stop the frequency converter or make step changes in the set-point reference to attempt to cause oscillation. Next, increase the PID Integral Time until the feedback signal stabilises. Then increase of the Integral Time by 15-50\%.
4. Use 20-95 PID Differentiation Time only for fastacting systems. The typical value is $25 \%$ of 20-94 PID Integral Time. Use the differential function only when the setting of the proportional gain and the integral time has been fully optimised. Make sure that oscillations of the feedback signal are sufficiently dampened by the low-pass filter for the feedback signal (6-16 Terminal 53 Filter Time Constant, 6-26 Terminal 54 Filter Time Constant, 5-54 Pulse Filter Time Constant \#29 or 5-59 Pulse Filter Time Constant \#33 as required).

Introduction

### 2.10 General Aspects of EMC

### 2.10.1 General Aspects of EMC Emissions

Electrical interference is most commonly found at frequencies in the range 150 kHz to 30 MHz . Airborne interference from the frequency converter system in the range 30 MHz to 1 GHz is generated from the inverter, motor cable, and the motor. Capacitive currents in the motor cable coupled with a high dU/dt from the motor voltage generate leakage currents. Screened motor cables increase the leakage current (see Illustration 2.18) because they have higher capacitance to earth than unscreened cables. If the leakage current is not filtered, it causes greater interference on the mains in the radio frequency range below 5 MHz . Since the leakage current ( $\left(_{1}\right.$ ) is carried back to the unit through the screen ( $1_{3}$ ), there is only a small electromagnetic field ( $\mathrm{I}_{4}$ ) from the screened motor cable.

While the screen reduces the radiated interference, it increases the low-frequency interference on the mains. Connect the motor cable screen to the frequency converter enclosure as well as the motor enclosure. To connect the screen, use integrated screen clamps to avoid twisted screen ends. The twisted screen ends increase the screen impedance at higher frequencies, which reduces the screen effect and increases the leakage current ( 14 ).
If a screened cable is used for fieldbus, relay, control cable, signal interface, or brake, mount the screen on the enclosure at both ends. In some situations, however, it is necessary to break the screen to avoid current loops.

Table 2.10 Legend to Illustration 2.18
Illustration 2.18 shows an example of a 6 -pulse frequency converter, but could be applicable to a 12 -pulse as well.

If placing the screen on a mounting plate, use a metal plate because the screen currents must be conveyed back to the frequency converter. Ensure good electrical contact from the mounting plate through the mounting screws to the frequency converter chassis. When unscreened cables are used, some emission requirements are not complied with, although the immunity requirements are observed.

To reduce the interference level from the entire system (unit and installation), make motor and brake cables as short as possible. Avoid placing cables with a sensitive signal level alongside motor and brake cables. Radio interference higher than 50 MHz (airborne) comes from the control electronics. For more information on EMC, see chapter 5.9 EMC-correct Installation.

### 2.10.2 Emission Requirements

According to the EMC product standard for adjustable speed frequency converters EN/IEC 61800-3:2004, the EMC requirements depend on the environment in which the frequency converter is installed. These environments along with the mains voltage supply requirements are defined in Table 2.11.

| Category | Definition | Conducted emission requirement <br> according to EN 55011 limits |
| :--- | :--- | :---: |
| C1 | Frequency converters installed in a home and office environment with a supply <br> voltage less than $1,000 \mathrm{~V}$. | Class B |
| C2 | Frequency converters installed in the home and office environment with a supply <br> voltage less than $1,000 \mathrm{~V}$. These frequency converters are not plug-in and cannot be <br> moved and are intended to for professional installation and commissioning. | Class A Group 1 |
| C3 | Frequency converters installed in an industrial environment with a supply voltage <br> lower than $1,000 \mathrm{~V}$. | Class A Group 2 |
| C4 | Frequency converters installed in an industrial environment with a supply voltage <br> equal to or above $1,000 \mathrm{~V}$ or rated current equal to or above 400 A or intended for <br> use in complex systems. | Make an EMC plan |

### 2.10.4 General Aspects of Harmonics Emission

A frequency converter takes up a non-sinusoidal current from mains, which increases the input current lrms. A nonsinusoidal current is transformed with a Fourier analysis and split up into sine-wave currents with different frequencies, such as harmonic currents $I_{n}$ with 50 Hz (or 60 $\mathrm{Hz})$ as the basic frequency:

|  | $\mathbf{I}_{\mathbf{1}}$ | $\mathbf{I}_{\mathbf{5}}$ | $\mathbf{I}_{\mathbf{7}}$ |
| :--- | :---: | :---: | :---: |
| [\mathrm{Hz}]{} | 50 | 250 | 350 |
|  | 60 | 300 | 420 |

Table 2.14 Harmonic Currents
The harmonics do not affect the power consumption directly but increase the heat losses in the installation (transformer, cables). In plants with a high percentage of rectifier load, maintain harmonic currents at a low level to avoid overload of the transformer and high temperature in the cables.

Illustration 2.19 Harmonics

## NOTICE

Some of the harmonic currents could disturb communication equipment connected to the same transformer or cause resonance with power-factor correction batteries.

To ensure low harmonic currents, the frequency converter is equipped with DC link inductors as standard, to reduce the input current lims by $40 \%$.

The voltage distortion on the mains supply voltage depends on the size of the harmonic currents multiplied by the mains impedance for the frequency in question. The individual voltage harmonics calculate the total voltage distortion (THD) using this formula:
$T H O \%=\sqrt{v_{5}^{2}+v_{7}^{2}+\ldots+v^{\frac{2}{N}}}$
( $\mathrm{U}_{\mathrm{N}} \%$ of U )

### 2.11 Immunity Requirements

The immunity requirements for frequency converters depend on the environment where they are installed. The requirements for the industrial environment are higher than the requirements for the home and office environment. All Danfoss frequency converters comply with the requirements for the industrial environment as well as the lower requirements for home and office environment with a large safety margin.

Introduction

To document immunity against electrical interference from electrical phenomena, the following immunity tests have been made on a system consisting of a frequency converter (with options if relevant), a screened control cable and a control box with potentiometer, motor cable, and motor.
The tests were performed in accordance with the following basic standards:

- EN 61000-4-2 (IEC 61000-4-2): Electrostatic discharges (ESD): Simulation of electrostatic discharges from human beings.
- EN 61000-4-3 (IEC 61000-4-3): Incoming electromagnetic field radiation, amplitude modulated simulation of the effects of radar and radio
communication equipment as well as mobile communications equipment.
- EN 61000-4-4 (IEC 61000-4-4): Burst transients: Simulation of interference brought about by switching a contactor, relay, or similar devices.
- EN 61000-4-5 (IEC 61000-4-5): Surge transients: Simulation of transients brought about for example, by lightning that strikes near installations.
- EN 61000-4-6 (IEC 61000-4-6): RF Common mode: Simulation of the effect from radiotransmission equipment joined by connection cables.

Introduction

### 2.12 Galvanic Isolation (PELV)

### 2.12.1 PELV - Protective Extra Low Voltage

## AWARNING

Installation at high altitude:
380-500 V, enclosure D, E, and F: At altitudes above 3
km, contact Danfoss regarding PELV.
525-690 V: At altitudes above 2 km , contact Danfoss regarding PELV.

## AWARNING

Touching the electrical parts could be fatal - even after the equipment has been disconnected from mains. Before touching any electrical parts, wait at least the amount of time indicated in Table 2.1.
Shorter time is allowed only if indicated on the specific unit's nameplate.
Also make sure that other voltage inputs have been disconnected.

Protection against electric shock is ensured when the electrical supply is of the PELV type and the installation complies with local/national regulations on PELV supplies.

All control terminals and relay terminals 01-03/04-06 comply with PELV. This does not apply to grounded Delta leg above 400 V . Galvanic isolation is obtained by fulfilling requirements for higher isolation and by providing the relevant creepage/clearance distances. These requirements are described in the EN 61800-5-1 standard.

To maintain PELV, all connections made to the control terminals must be PELV. The components that make up the electrical isolation also comply with the requirements for higher isolation and the relevant test as described in EN 61800-5-1.

The PELV galvanic isolation can be shown in 6 locations, as shown in Illustration 2.20.

1. Power supply (SMPS) including signal isolation of $U_{D C}$, indicating the intermediate current voltage.
2. Gate drive that runs the IGBTs (trigger transformers/opto-couplers).
3. Current transducers.
4. Optocoupler, brake module.
5. Internal inrush, RFI, and temperature measurement circuits.
6. Custom relays.

Illustration 2.20 Galvanic Isolation

The functional galvanic isolation - indicated by a and b in Illustration 2.20 - is for the 24 V backup option and for the RS-485 standard bus interface.

### 2.13 Earth Leakage Current

Follow national and local codes regarding protective earthing of equipment with a leakage current $>3.5 \mathrm{~mA}$. Frequency converter technology implies high frequency switching at high power, which generates a leakage current in the earth connection. A fault current at the frequency converter's output power terminals could contain a DC component that can charge the filter capacitors and cause a transient earth current. The earth leakage current is affected by the following:

- RFI filtering
- $\quad$ screened motor cables
- $\quad$ frequency converter power (see Illustration 2.21)
- line distortion (see Illustration 2.22)

Illustration 2.21 Influence of the Cable Length and Power Size on the Leakage Current

Introduction

Illustration 2.22 Influence of Line Distortion on Leakage Current

## NOTICE

When a filter is used, turn off 14-50 RFI Filter when charging the filter to avoid a high leakage current making the RCD switch.

If the leakage current exceeds 3.5 mA , EN/IEC61800-5-1
(Power Drive System Product Standard) requires that earth grounding must be reinforced in one of the following ways:

- Earth ground wire (terminal 95) of at least 10 mm ${ }^{2}$
- $\quad 2$ separate earth ground wires both complying with the dimensioning rules

See EN/IEC61800-5-1 and EN50178 for further information.

## Using RCDs

Where residual current devices (RCDs), also known as earth leakage circuit breakers (ELCBs), are used, comply with the following:

- Use RCDs of type B only, capable of detecting AC and DC currents
- Use RCDs with an inrush delay to prevent faults due to transient earth currents
- Dimension RCDs according to the system configuration and environmental considerations

See also Protection Against Electrical Hazards.

### 2.14 Control with Brake Function

### 2.14.1 Selection of Brake Resistor

In certain applications, for instance centrifuges, it is desirable to bring the motor to a stop more rapidly than can be achieved through controlling via ramp down or by free-wheeling. In such applications, dynamic braking with a braking resistor can be utilised. Using a braking resistor ensures that the energy is absorbed in the resistor and not in the frequency converter.

If the amount of kinetic energy transferred to the resistor in each braking period is not known, the average power can be calculated based on the cycle time and braking time also called intermittent duty cycle. The resistor intermittent duty cycle is an indication of the duty cycle at

Introduction
which the resistor is active. Illustration 2.25 shows a typical braking cycle.

The intermittent duty cycle for the resistor is calculated as follows:

Duty Cycle $=t_{b} / T$

T = cycle time in seconds
$\mathrm{t}_{\mathrm{b}}$ is the braking time in seconds (as part of the total cycle time)

Illustration 2.25 Typical Braking Cycle

Danfoss offers brake resistors with duty cycles of $10 \%$ and $40 \%$ suitable for use with the VLT ${ }^{\circledR}$ AQUA Drive FC 202. If a $10 \%$ duty cycle resistor is applied, it can absorb braking power up to $10 \%$ of the cycle time with the remaining $90 \%$ being used to dissipate heat from the resistor.

For resistor selection information, refer to the Brake Resistor Design Guide.

## NOTICE

If a short circuit in the brake transistor occurs, power dissipation in the brake resistor is only prevented by using a mains switch or contactor to disconnect the mains for the frequency converter. (The frequency converter can control the contactor).

### 2.14.2 Control with Brake Function

The brake is protected against short-circuiting of the brake resistor, and the brake transistor is monitored to ensure that short-circuiting of the transistor is detected. A relay/ digital output can be used to protect the brake resistor against overloading by generating a fault in the frequency converter.
In addition, the brake makes it possible to read out the momentary power and the mean power for the latest 120 s . The brake can also monitor the power energizing and make sure that it does not exceed the limit selected in

2-12 Brake Power Limit (kW). Use 2-13 Brake Power
Monitoring to select what function occurs when the power transmitted to the brake resistor exceeds the limit set in 2-12 Brake Power Limit (kW).

## ACAUTION

Monitoring the brake power is not a safety function; a thermal switch is required for that purpose. The brake resistor circuit is not earth leakage protected.

Over voltage control (OVC) can be selected as an alternative brake function in 2-17 Over-voltage Control. This function is active for all units and ensures that if the DC link voltage increases, the output frequency also increases to limit the voltage from the DC link, thereby avoiding a trip.

## NOTICE

OVC cannot be activated when running a PM motor, while 1-10 Motor Construction is set to [1] PM non-salient SPM.

### 2.15 Mechanical Brake Control

### 2.15.1 Brake Resistor Cabling

## EMC (twisted cables/shielding)

Twist the wires to reduce electrical noise between the brake resistor and the frequency converter. For enhanced EMC performance, use a metal screen.

### 2.16 Extreme Running Conditions

## Short circuit (motor phase - phase)

The frequency converter is protected against short circuits by current measurement in each of the three motor phases or in the DC link. A short circuit between two output phases causes an overcurrent in the inverter. The inverter is turned off individually when the short circuit current exceeds the permitted value (Alarm 16 Trip Lock.
To protect the drive against a short circuit at the load sharing and brake outputs, see the design guidelines.

## Switching on the output

Switching on the output between the motor and the frequency converter is fully permitted and cannot damage the frequency converter, but it can cause fault messages to appear.

## Motor-generated overvoltage

The voltage in the intermediate circuit is increased when the motor acts as a generator.

## Overvoltage occurs in the following cases:

1. The load drives the motor, generating energy.
2. During deceleration ("ramp-down") if the moment of inertia is high, the friction is low, and the ramp-down time is too short for the energy to be

Introduction
dissipated as a loss in the frequency converter, the motor, and the installation.
3. In-correct slip compensation setting can cause higher DC link voltage.

The control unit could attempt to correct the ramp if possible (2-17 Over-voltage Control).
The inverter turns off to protect the transistors and the intermediate circuit capacitors when a certain voltage level is reached.
See 2-10 Brake Function and 2-17 Over-voltage Control to select the method used for controlling the intermediate circuit voltage level.

High temperature
High ambient temperature can cause the frequency converter to overheat.

## Mains drop-out

During a mains drop-out, the frequency converter keeps running until the intermediate circuit voltage drops below the minimum stop level, which is typically $15 \%$ below the lowest rated supply voltage.

The mains voltage before the drop-out and the motor load determines how long it takes for the inverter to coast.

## Static overload in $\mathrm{VVC}^{+}$mode

When the frequency converter is overloaded (the torque limit in 4-16 Torque Limit Motor Mode/4-17 Torque Limit Generator Mode is reached), the controls reduces the output frequency to reduce the load. If the overload is excessive, a current could occur that makes the frequency converter cut out after approx. 5-10 s .

Operation within the torque limit is limited in time (0-60 s) in 14-25 Trip Delay at Torque Limit.

### 2.16.1 Motor Thermal Protection

Danfoss uses motor thermal protection to keep the motor from being overheated. It is an electronic feature that simulates a bimetal relay based on internal measurements. The characteristic is shown in Illustration 2.26

Illustration 2.26 Motor Thermal Protection

In Illustration 2.26, the X -axis is showing the ratio between $I_{\text {motor }}$ and $I_{\text {motor }}$ nominal. The $Y$-axis is showing the time in seconds before the ETR cuts off and trips the frequency converter. The curves are showing the characteristic nominal speed at twice the nominal speed and at 0.2 x the nominal speed.

At lower speed the ETR cuts off at a lower temperature due to less cooling of the motor. In that way, the motor is protected from being over heated even at low speed. The ETR feature is calculating the motor temperature based on actual current and speed. The calculated temperature is visible as a read out parameter in 16-18 Motor Thermal in the frequency converter.

The thermistor cut-out value is $>3 \mathrm{k} \Omega$.

Integrate a thermistor (PTC sensor) in the motor for winding protection.

Motor protection can be implemented using a range of techniques: PTC sensor in motor windings; mechanical thermal switch (Klixon type); or Electronic Thermal Relay (ETR).

Introduction

## Summary

With the torque limit feature, the motor is protected from being overloaded independent of the speed. With the ETR the motor is protected for being over heated and there is no need for any further motor protection. That means when the motor is heated up the ETR timer controls for how long time the motor can be running at the high temperature before it is stopped in order to prevent over heating. If the motor is overloaded without reaching the temperature where the ETR shuts off the motor, the torque limit is protecting the motor and application for being overloaded.

ETR is activated in 1-90 Motor Thermal Protection and is controlled in 4-16 Torque Limit Motor Mode. The time before the torque limit warning trips the frequency converter is set in 14-25 Trip Delay at Torque Limit.

- Relay Module MCB 105
- Extended LCP frame and enlarged terminal cover
- Label for covering access to switches S201, S202, and S801
- Cable strips for fastening cables to relay module

How to add the MCB 105 option:

- See mounting instructions in the beginning of section Options and Accessories
- The power to the live part connections on relay terminals must be disconnected.
- Do not mix live parts with control signals (PELV).

### 3.1.7 24 V Back-Up Option MCB 107 (Option D)

## External 24 V DC Supply

An external 24 V DC supply can be installed for lowvoltage supply to the control card and any option card installed. The external power supply enables full operation of the LCP (including the parameter setting) and fieldbuses without mains supplied to the power section.

The inputs are protected.

Terminal numbers:
Terminal 35: - external 24 V DC supply.
Terminal 36: + external 24 V DC supply.
Follow these steps:

1. Remove the LCP blind cover
2. Remove the terminal cover
3. Remove the cable de-coupling plate and the plastic cover underneath
4. Insert the 24 V DC backup external supply option in the option slot
5. Mount the cable de-coupling plate
6. Attach the terminal cover and the LCP or blind cover.

When MCB $107,24 \mathrm{~V}$ backup option is supplying the control circuit, the internal 24 V supply is automatically disconnected.

### 3.1.8 Analog I/O option MCB 109

The Analog I/O card is supposed to be used in the following cases:

- Providing battery back-up of clock function on control card
- As general extension of analog I/O selection available on control card, for example, for multizone control with three pressure transmitters
- Turning frequency converter into de-central I/O block supporting Building Management System with inputs for sensors and outputs for operating dampers and valve actuators
- Support Extended PID controllers with I/Os for set point inputs, transmitter/sensor inputs, and outputs for actuators.

### 3.1.9 Extended Cascade Controller MCO 101 and Advanced Cascade Controller, MCO 102

Cascade control is a common control system used to control parallel pumps or fans in an energy efficient way.

The cascade controller option provides the capability to control multiple pumps configured in parallel in a way that makes them appear as a single larger pump.

To satisfy the required system output for flow or pressure when using cascade controllers, the individual pumps are automatically turned on (staged) and turned off (destaged) as needed. The speed of pumps connected to VLT ${ }^{\circledR}$ AQUA Drive FC 202 is also controlled to provide a continuous range of system output.

Illustration 3.7 Cascade Control of Multiple Pumps

The cascade controllers are optional hardware and software components that can be added to the $\mathrm{VLT}^{\circledR}$ AQUA Drive FC 202. It consists of an option board containing three relays that is installed in the B option location on the drive. Once options are installed, the parameters to support the cascade controller functions are available through the control panel in parameter group 27-
${ }^{* *}$ Extended Cascade Control. The extended cascade controller offers more functionality than the basic cascade controller. It can be used to extend the basic cascade with three relays and even to eight relays with the advanced cascade control card installed.

While the cascade controller is designed for pumping applications and this document describes the cascade controller for this application, it is also possible to use the cascade controllers for any application requiring multiple motors configured in parallel.

## Master/follower operation

The cascade controller software runs from a single VLT AQUA Drive with the cascade controller option card installed. This frequency converter is referred to as the master drive. It controls a set of pumps each controlled by a frequency converter or connected directly to mains through a contactor or through a soft starter.

Each additional frequency converter in the system is referred to as a follower drive. These frequency converters do not need the cascade controller option card installed. They are operated in open loop mode and receive their speed reference from the master drive. The pumps connected to these frequency converters are referred to as variable speed pumps.
Each additional pump connected to mains through a contactor or through a soft starter is referred to as a fixed speed pump.
Each pump, variable speed or fixed speed, responds to a relay in the master drive. The frequency converter with the cascade controller option card installed has five relays available for controlling pumps. Two relays are standard in the frequency converter and an additional 3 relays are found on the option card MCO 101 or 8 relays and 7 digital inputs on option card MCO 102.

The difference between MCO 101 and MCO 102 is mainly the number of optional relays being made available for the frequency converter. When MCO 102 is installed, the relays option card MCB 105 can be mounted in the B-slot.

The cascade controller can control a mix of variable speed and fixed speed pumps. For simplicity of description within this manual, pressure and flow are used to describe the variable output of the set of pumps controlled by the cascade controller.

### 3.1.10 Extended Cascade Controller MCO 101

The MCO 101 option includes 3 pieces of change-over contacts and can be fitted into option slot B.

How to add the MCO 101 option:

- The power to the frequency converter must be disconnected.
- The power to the live part connections on relay terminals must be disconnected.
- Remove the LCP, the terminal cover, and the cradle from the FC 202.
- Fit the MCO 101 option in slot B.
- Connect the control cables and relief the cables by the enclosed cable strips.
- Various systems must not be mixed.
- Fit the extended cradle and terminal cover.
- Replace the LCP
- Connect power to the frequency converter.

### 3.1.11 Brake Resistors

In applications where the motor is used as a brake, energy is generated in the motor and sent back into the frequency converter. If the energy cannot be transported back to the frequency converter, it increases the voltage in the DC-line. In applications with frequent braking and/or high inertia loads, this increase leads to an over voltage trip in the converter and finally a shutdown. Brake resistors are used to dissipate the excess energy resulting from the regenerative braking. The resistor is selected in respect to its ohmic value, its power dissipation rate, and its physical size. Danfoss offers a wide variety of different resistors that are specially designed to our frequency converters. See chapter 2.14 Control with Brake Function for the dimensioning of brake resistors. Code numbers can be found in chapter 4 How to Order.

### 3.1.13 Input Filters

The 6-pulse diode rectifier causes the harmonic current distortion. The harmonic currents affect the installed serial equipment identical to reactive currents. Consequently, harmonic current distortion can result in overheating of the supply transformer, cables and so on. Depending on the impedance of the power grid, harmonic current distortion can lead to voltage distortion also affecting other equipment powered by the same transformer. Voltage distortion is increasing losses, causes premature aging and worst of all erratic operation. The built-in DC coil reduces most harmonics, but if more reduction is needed, Danfoss offers two types of passive filters.

The Danfoss AHF 005 and AHF 010 are advanced harmonic filters, not to be compared with traditional harmonic trap filters. The Danfoss harmonic filters have been specially designed to match the Danfoss frequency converters.

AHF 010 is reducing the harmonic currents to less than $10 \%$ and the AHF 005 is reducing harmonic currents to less than $5 \%$ at $2 \%$ background distortion and $2 \%$ imbalance.

### 3.1.14 Output Filters

The high-speed switching of the frequency converter produces some secondary effects, which influence the motor and the enclosed environment. Two different filter types, the dU/dt and the Sine-wave filters, are in place to address these side effects.

## dU/dt filters

The combination of rapid voltage and current increase cause motor insulation stresses. The rapid energy changes can also be reflected back to the DC-line in the inverter and cause shut down. The dU/dt filter is designed to reduce the voltage rise time/the rapid energy change in the motor and by that intervention avoid premature aging and flashover in the motor insulation. $\mathrm{dU} / \mathrm{dt}$ filters have a positive influence on the radiation of magnetic noise in the cable that connects the frequency converter to the motor. The voltage wave form is still pulse shaped, but the $\mathrm{dU} / \mathrm{dt}$ ratio is reduced in comparison with the installation without filter.

## Sine-wave filters

Sine-wave filters are designed to let only low frequencies pass. High frequencies are shunted away which results in a sinusoidal phase to phase voltage waveform and sinusoidal current waveforms.
With the sinusoidal waveforms, the use of special frequency converter motors with reinforced insulation is no longer needed. The acoustic noise from the motor is also damped as a consequence of the wave condition. Besides the features of the dU/dt filter, the sine-wave filter also reduces insulation stress and bearing currents in the motor thus leading to prolonged motor lifetime and longer periods between services. Sine-wave filters enable use of longer motor cables in applications where the motor is installed far from the frequency converter. The length is unfortunately limited because the filter does not reduce leakage currents in the cables.

### 3.2 High Power Options

## ACAUTION

A door fan is required on the enclosure to remove the heat losses not contained in the back channel of the frequency converter and any additional losses generated from other components installed inside the enclosure. The total required air flow must be calculated so that the appropriate fans can be selected. Some enclosure manufacturers offer software for performing the calculations (that is, Rittal Therm software). If the frequency converter is the only heat generating component in the enclosure, the minimum airflow required at an ambient temperature of $45^{\circ} \mathrm{C}$ for the D3h and D4h frequency converter is $391 \mathrm{~m}^{3} / \mathrm{h}(230 \mathrm{cfm})$. The minimum airflow required at an ambient temperature of $45^{\circ} \mathrm{C}$ for the E 2 frequency converter is $782 \mathrm{~m}^{3} / \mathrm{h}$ ( 460 cfm).

### 3.2.1 Installation of Back Channel Cooling Kit in Rittal Enclosures

This section describes the installation of IP00/IP20/chassis frequency converters with back channel cooling kits in Rittal enclosures. In addition to the enclosure, a floor mounting pedestal is required.

Illustration 3.14 Installation of IP00/IP20/Chassis in Rittal TS8 Enclosure.

The minimum enclosure dimension is:

- D3h frame: Depth 500 mm and width 400 mm
- D4h frame: Depth 500 mm and width 600 mm .
- E2 frame: Depth 600 mm and width 800 mm .

Selection

The maximum depth and width must comply with the installation requirements. When using multiple frequency converters in one enclosure, mount each on its own back panel and support each along the mid-section of the panel. The back channel cooling kits do not support the "in frame" mounting of the panel (see Rittal TS8 catalogue for details). The cooling kits listed in Table 3.14 are suitable for use only with IP00/IP20 chassis frequency converters in

Rittal TS8 IP 20 and UL and NEMA 1 and IP 54 and UL and NEMA 12 enclosures.

## ACAUTION

For the E2 frames, it is important to mount the plate at the absolute rear of the Rittal enclosure due to the

If more duct work is added externally to the Rittal cabinet the pressure drop in the ducting must be calculated. See chapter 5.2.7 Cooling and Airflow for further information.

### 3.2.2 Outside Installation/NEMA 3R Kit for Rittal Enclosures

Illustration 3.15 Cutaway Side View of Cabinet

This section is for the installation of NEMA 3R kits available for the frequency converter frames D3h, D4h and E2. These kits are designed and tested to be used with IP00/IP20/ Chassis versions of these frames in Rittal TS8 NEMA 3R or NEMA 4 enclosures. The NEMA-3R enclosure is an outdoor enclosure that provides a degree of protection against rain and ice. The NEMA-4 enclosure is an outdoor enclosure that provides a greater degree of protection against weather and hosed water.
The minimum enclosure depth is 500 mm ( 600 mm for E2 frame) and the kit is designed for a 600 mm ( 800 mm for E2 frame) wide enclosure. Other enclosure widths are possible, however more Rittal hardware is required. Consult the installation requirements for the maximum depth and width.

## NOTICE

The current rating of frequency converters in D3h and D4h frames are de-rated by 3\%, when adding the NEMA 3R kit. Frequency converters in E2 frames require no derating.

### 3.2.6 D-frame Options

### 3.2.6.1 Load Share Terminals

Load share terminals enable the connection of the DC circuits of several frequency converters. Load share terminals are available in IP20 frequency converters and extend out the top of the unit. A terminal cover, supplied with the frequency converter, must be installed to maintain the IP20 rating of the enclosure. Illustration 3.18 shows both the covered and uncovered terminals.

Illustration 3.18 Load Share or Regeneration Terminal with Cover (Left) and without Cover (Right)

### 3.2.6.2 Regeneration Terminals

Regen (regeneration) terminals can be supplied for applications that have a regenerative load. A regenerative unit, supplied by a third party, connects to the regen terminals so that power can be sent back onto the mains, resulting in energy savings. Regen terminals are available in IP20 frequency converters and extend out the top of the unit. A terminal cover, supplied with the frequency converter, must be installed to maintain the IP20 rating of the enclosure. Illustration 3.18 shows both the covered and uncovered terminals.

### 3.2.6.3 Anti-Condensation Heater

An anti-condensation heater can be installed inside the frequency converter to prevent condensation from forming inside the enclosure when the unit is turned off. The heater is controlled by customer-supplied 230 V AC. For best results, operate the heater only when the unit is not running.

A 2.5 amp time-delay fuse, such as the Bussmann
LPJ-21/2SP, is recommended to protect the heater.

### 3.2.6.4 Brake Chopper

A brake chopper can be supplied for applications that have a regenerative load. The brake chopper connects to a brake resistor, which consumes the braking energy and prevents an overvoltage fault on the DC bus. The brake chopper is automatically activated when the DC bus voltage exceeds a specified level, depending on the nominal voltage of the frequency converter.

### 3.2.6.5 Mains Shield

The mains shield is a Lexan cover installed inside the enclosure to provide protection according to VBG-4 accident-prevention requirements.

### 3.2.6.6 Ruggedized Printed Circuit Boards

Ruggedized boards are available for marine and other applications that experience higher than average vibration.

## NOTICE

Ruggedized boards are required to meet marine approval requirements.

### 3.2.6.7 Heat Sink Access Panel

An optional heat sink access panel is available to facilitate cleaning of the heat sink. Debris buildup is typical in environments prone to airborne contaminants, such as the textile industry.

### 3.2.6.8 Mains Disconnect

The disconnect option is available in both varieties of option cabinets. The position of the disconnect changes based on the size of the options cabinet and whether other options are present. Table 3.19 provides more detail about which disconnects are used.

## NOTICE

In applications requiring UL listing, when the frequency converter is supplied with a contactor, the customer must provide external fusing to maintain the UL rating of the frequency converter and a short circuit current rating of 100,000 A. See chapter 5.3.8 Fuse Specifications for fuse recommendations.

### 3.2.6.10 Circuit Breaker

Table 3.21 provides details on the type of circuit breaker provided as an option with the various units and power ranges.

### 3.2.7 Frame Size F Options

## Space Heaters and Thermostat

Mounted on the cabinet interior of frame size F frequency converters, space heaters controlled via an automatic thermostat help control humidity inside the enclosure, prolonging component life in damp environments. The thermostat default settings turn on the heaters at $10^{\circ} \mathrm{C}$ $\left(50{ }^{\circ} \mathrm{F}\right.$ ) and turn them off at $15.6^{\circ} \mathrm{C}\left(60^{\circ} \mathrm{F}\right)$.

## Cabinet light with power outlet

A light mounted on the cabinet interior of frame size $F$ frequency converters increases visibility during servicing and maintenance. The housing includes a power outlet for temporarily powering tools or other devices. The power outlet is available in two voltages:

- $\quad 230 \mathrm{~V}, 50 \mathrm{~Hz}, 2.5 \mathrm{~A}, \mathrm{CE} / \mathrm{ENEC}$
- $120 \mathrm{~V}, 60 \mathrm{~Hz}, 5 \mathrm{~A}, \mathrm{UL} / \mathrm{cUL}$

## Transformer tap setup

Transformer T1 requires that taps be set to the proper input voltage if any of the following options are installed:

- Space heaters and thermostat
- Cabinet light with power outlet

A 380-480/500 V frequency converter is initially set to the 525 V tap and a 525-690 V frequency converter is set to the 690 V tap to ensure no over-voltage of secondary equipment occurs if the tap is not changed before power is applied. See Table 3.22 to set the proper tap on TB3 located in the rectifier cabinet. For location in the frequency converter, see chapter 5.4.2 Power Connections.

| Input voltage range [V] | Tap to select [V] |
| :--- | :--- |
| $380-440$ | 400 |
| $441-490$ | 460 |
| $491-550$ | 525 |
| $551-625$ | 575 |
| $626-660$ | 660 |
| $661-690$ | 690 |

## NAMUR terminals

NAMUR is an international association of automation technology users in the process industries, primarily chemical and pharmaceutical industries in Germany. Selection of this option provides terminals organised and labelled to the specifications of the NAMUR standard for drive input and output terminals, which requires an MCB 112PTC thermistor card and an MCB 113 extended relay card.

## Residual current device (RCD)

Uses the core balance method to monitor ground fault currents in grounded and high-resistance grounded systems (TN and TT systems in IEC terminology). There is a pre-warning (50\% of main alarm set-point) and a main alarm set-point. Each set-point is associated with an SPDT

Selection
alarm relay for external use. The RCD requires an external "window-type" current transformer, which is supplied and installed by the customer. Features include:

- Integrated into the safe torque off circuit of the frequency converter
- IEC 60755 Type B device monitors AC, pulsed DC, and pure DC ground fault currents
- LED bar graph indicator of the ground fault current level from 10-100\% of the set-point
- Fault memory
- [Test/Reset] key

Insulation resistance monitor (IRM)
Monitors the insulation resistance in ungrounded systems (IT systems in IEC terminology) between the system phase conductors and ground. There is an ohmic pre-warning and a main alarm set-point for the insulation level. Each set-point is associated with an SPDT alarm relay for external use.

## NOTICE

Only one insulation resistance monitor can be connected to each ungrounded (IT) system.

Features include:

- Integrated into the safe torque off circuit of the frequency converter
- LCD display of the ohmic value of the insulation resistance
- Fault Memory
- [Info], [Test] and [Reset] keys

## IEC emergency stop with Pilz safety relay

Includes a redundant four-wire emergency-stop push button mounted on the front of the enclosure. A Pilz relay monitors it with the safe torque off circuit and the mains contactor located in the options cabinet.

## Safe Stop with Pilz Relay

Provides a solution for the "Emergency Stop" option without the contactor in F-Frame frequency converters.

## Manual motor starters

Provides 3-phase power for electric blowers that are often required for larger motors. Power for the starters is provided from the load side of any supplied contactor, circuit breaker, or disconnect switch. Power is fused before each motor starter, and is off when the incoming power to the frequency converter is off. If a 30 A fuse-protected circuit is ordered, only one starter is allowed, otherwise 2 starters may be selected. The starter is integrated into the safe torque off circuit.
Unit features include:

- Operation switch (on/off)
- Short-circuit and overload protection with test function
- Manual reset function

## 30 A, fuse-protected terminals

- 3-phase power matching incoming mains voltage for powering auxiliary customer equipment
- Not available if 2 manual motor starters are selected
- Terminals are off when the incoming power to the frequency converter is off
- Power for the fused protected terminals is provided from the load side of any supplied contactor, circuit breaker, or disconnect switch.

## 24 V DC power supply

- 5 A, 120 W, 24 V DC
- Protected against output over-current, overload, short circuits, and over-temperature
- For powering customer-supplied accessory devices such as sensors, PLC I/O, contactors, temperature probes, indicator lights, and/or other electronic hardware
- Diagnostics include a dry DC-ok contact, a green DC-ok LED, and a red overload LED

## External temperature monitoring

Monitors temperatures of external system components such as the motor windings and/or bearings. This option includes 5 universal input modules. The modules are integrated into the safe torque off circuit and can be monitored via a fieldbus network. This requires the purchase of the safe torque off option and separate module/bus couplers.

## Universal Inputs (5)

Signal types:

- RTD inputs (including PT100), 3-wire or 4-wire
- Thermocouple
- Analog current or analog voltage

Additional features:

- One universal output, configurable for analog voltage or analog current
- Two output relays (N.O.)
- Dual-line LC display and LED diagnostics
- Sensor lead wire break, short-circuit, and incorrect polarity detection
- Interface setup software

How to Order

## 4 How to Order

### 4.1 Ordering Form

### 4.1.1 Drive Configurator

It is possible to design a VLT ${ }^{\circledR}$ AQUA Drive FC 202 frequency converter according to the application requirements by using the ordering number system.

To order standard frequency converters and frequency converters with integral options, send a type code string describing the product to the Danfoss sales office. An example type code:

## FC-202N132T4E21H2XGCXXXSXXXXAXBKCXXXXDX

The meaning of the characters in the string can be located in the pages containing the ordering numbers in chapter 4.1 Ordering Form. In the example above, a Profibus/LON works option and a general purpose I/O option is included in the frequency converter.

Ordering numbers for VLT AQUA Drive standard variants can also be located in the chapter chapter 4.2 Ordering Numbers.

Use the web-based Drive Configurator, to configure the right frequency converter for the right application and generate the type code string. The Drive Configurator automatically generates an eight-digit sales number for the local sales office. Furthermore,it's possible to establish a project list with several products and send it to a Danfoss sales representative.

The Drive Configurator can be found on the global internet site: www.danfoss.com/drives.

## NOTICE

Type code information includes frame sizes $A, B$ and $C$. For detailed information on these products, reference the relevant design guide.

### 4.2.2 Advanced Harmonic Filters

Harmonic filters are used to reduce mains harmonics:

- AHF 010: $10 \%$ current distortion
- AHF 005: 5\% current distortion

For detailed information on advanced harmonic filters, see the Advanced Harmonic Filters Design Guide.

$R_{\text {min }}=$ Minimum brake resistance that can be used with this frequency converter. If the frequency converter includes multiple brake choppers, the resistance value is the sum of all resisters in parallel
Rbr, nom=Nominal resistance required to achieve $150 \%$ braking torque.

1) Larger frequency converters include multiple inverter modules with a brake chopper in each inverter. Connect equal resistors to each brake chopper.

Table 5.3 Product Overview, 12-pulse Frequency Converters

## NOTICE

The F-Frames are available with or without options cabinet. The F8, F10 and F12 consist of an inverter cabinet on the right and rectifier cabinet on the left. The F9, F11 and F13 have an additional options cabinet left of the rectifier cabinet. The F9 is an F8 with an additional options cabinet. The F11 is an F10 with an additional options cabinet. The F13 is an F12 with an additional options cabinet.

### 5.1.1 Mechanical Mounting

1. Drill holes in accordance with the measurements given.
2. Provide screws suitable for the mounting surface. Retighten all 4 screws.

The frequency converter allows side-by-side installation. The back wall must always be solid.

Table 5.4 Required Free Air Space Above and Below Frequency Converter

## NOTICE

If using a kit to direct the heatsink cooling air out the back of the frequency converter, the required top clearance is 100 mm .

### 5.1.2 Pedestal Installation of D-frames

The D7h and D8h frequency converters are shipped with a pedestal and a wall spacer. Before securing the enclosure to the wall, install the pedestal behind the mounting flange as shown in Illustration 5.1.

Illustration 5.1 Wall Mounting Spacer

To install a pedestal-mounted D-frame unit, perform the following steps as shown in Illustration 5.2:

1. Attach the pedestal to the back channel using 2 M10 nuts.
2. Fasten 2 M5 screws through the back pedestal flange into the pedestal drive mounting bracket.
3. Fasten 4 M 5 screws through the front pedestal flange into the front gland plate mounting holes.

### 5.1.3 Pedestal Installation of F-frames

The F-frame frequency converters are shipped with a pedestal. The F-frame pedestals use 8 bolts instead of 4, as shown in Illustration 5.3.

Illustration 5.3 Pedestal Bolt Installation

To install a pedestal-mounted F-frame unit, perform the following steps:

1. If using a kit to direct the airflow from the heat sink to the outside vent on the back of the frequency converter, verify there is a minimum of 100 mm ceiling clearance.
2. Install each $M 8 \times 60 \mathrm{~mm}$ bolt with lock washer and flat washer through the frame into the threaded hole in the base. Install 4 bolts per cabinet. Refer to Illustration 5.4
3. Install each $M 10 \times 30 \mathrm{~mm}$ bolt with captive lock washer and flat washer through the base plate and into the threaded hole in the base. Install 4 bolts per cabinet. Refer to Illustration 5.4

Illustration 5.4 Fastener Location Detail

### 5.1.4 Safety Requirements of Mechanical Installation

## ACAUTION

To avoid serious injury or equipment damage, observe the information in the field mounting and integration kits, especially when installing large units.

## ACAUTION

The frequency converter is cooled with air circulation. To protect the unit from overheating, ensure that the ambient temperature does not exceed the maximum rated temperature. If the ambient temperature is in the range of $45-55^{\circ} \mathrm{C}$, derating of the frequency converter is relevant. See chapter 8.5.5 Derating for Ambient Temperature.
Failure to consider derating for ambient temperature can reduce the service life of the frequency converter.

### 5.2 Pre-installation

### 5.2.1 Planning the Installation Site

## NOTICE

To avoid extra work during and after installation, it is important to plan the installation of the frequency converter in advance.

Select the best possible operation site by considering the following:

- Ambient operating temperature
- Installation method
- How to cool the unit
- Position of the frequency converter
- Cable routing
- Ensure the power source supplies the correct voltage and necessary current
- Ensure that the motor current rating is within the maximum current from the frequency converter
- If the frequency converter is without built-in fuses, ensure that the external fuses are rated correctly.

### 5.2.2 Receiving the Frequency Converter

When receiving the frequency converter, make sure that the packaging is intact, and be aware of any potential damage to the unit during transport. If damage has occurred, contact the shipping company immediately to claim the damage.

Also, look at the nameplate as shown in Illustration 5.5 and verify the order matches the information found on the nameplate.

### 5.2.3 Transportation and Unpacking

Before unpacking the frequency converter, position it as close as possible to the final installation site. Remove the box and leave the frequency converter on the pallet as long as possible.

### 5.2.4 Lifting

Lift the frequency converter using the dedicated lifting eyes. For all E2 (IP00) enclosures, use a bar to avoid bending the lifting holes of the frequency converter.

The following illustrations demonstrate the recommended lifting methods for the different frame sizes. In addition to Illustration 5.8, Illustration 5.9, and Illustration 5.10, a spreader bar is an acceptable way to lift the F-frame.

## AWARNING

The lifting bar must be able to handle the weight of the frequency converter. See Table 5.2 for the weight of each frame size. Maximum diameter for the bar is 2.5 cm (1 inch). The angle from the top of the drive to the lifting cable should be $60^{\circ}$ or greater.

Illustration 5.8 Recommended Lifting Method, Frame Sizes F1, F2, F9 and F10

## NOTICE

The pedestal is packaged separately and included in the shipment. Mount the frequency converter on the pedestal in its final location. The pedestal allows proper airflow and cooling to the frequency converter. See chapter 5.1.3 Pedestal Installation of F-frames.

### 5.2.5 Tools Needed

To perform the mechanical installation, the following tools are needed:

- Drill with 10 mm or 12 mm drill bits.
- Tape measurer.
- Wrench with relevant metric sockets (7-17 mm).
- Wrench extensions.
- $\quad$ Sheet metal punch for conduits or cable glands in IP21 (NEMA 1) and IP54 (NEMA 12) units.
- Lifting bar to lift the unit (rod or tube max. $\varnothing 25$ mm (1 inch), able to lift minimum 400 kg ( 880 lbs)).
- Crane or other lifting aid to place the frequency converter in position.
- Use a Torx T50 tool to install the E1 in IP21 and IP54 enclosure types.

### 5.2.6 General Considerations

## Wire Access

Ensure that proper cable access is present including necessary bending allowance. As the IP00 enclosure is open to the bottom, cables must be fixed to the back panel of the enclosure where the frequency converter is mounted.

## NOTICE

All cable lugs/shoes must mount within the width of the terminal bus bar.

## Space

Ensure proper space above and below the frequency converter to allow airflow and cable access. In addition, space in front of the unit must be considered to enable opening of the door of the panel.

### 5.2.7 Cooling and Airflow

## Cooling

Cooling can be achieved through one of the following methods:

- cooling ducts in the bottom and the top of the unit
- back-channel cooling
- combination of the cooling ducts and the back-channel cooling

## Duct Cooling

A dedicated option has been developed to optimise installation of IP00/chassis frequency converters in Rittal TS8 enclosures utilizing the fan of the frequency converter for forced air cooling of the back channel. The air out the top of the enclosure could be ducted outside a facility so the heat losses from the back channel are not dissipated within the control room, reducing air conditioning requirements of the facility.

## Back Cooling

The back channel air can also be ventilated in and out the back of a Rittal TS8 enclosure. Using this method, the back channel could take air from outside the facility and then return the heat losses outside the facility, thus reducing air conditioning requirements.

## NOTICE

A door fan is required on the enclosure to remove the heat losses not contained in the back channel of the frequency converter and any additional losses generated from other components installed inside the enclosure. The total required air flow must be calculated so that the appropriate fans can be selected. Some enclosure manufacturers offer software for performing the calculations.

## Airflow

The necessary airflow over the heat sink must be secured. The flow rate is shown in Table 5.5.

| Drive type | Drive size |  | Frame size | Enclosure protection | Airflow m3/h (cfm) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

How to Install

## D-frame Cooling Fans

All frequency converters in this size range are equipped with cooling fans to provide airflow along the heatsink. Units in IP21 (NEMA 1) and IP54 (NEMA 12) enclosures have a fan mounted in the enclosure door to provide more airflow to the unit. IP20 enclosures have a fan mounted to the top of the unit for more cooling. There is a small 24 V DC mixing fan mounted under the input plate. This fan operates anytime the frequency converter is powered on.
DC voltage from the power card powers the fans. The mixing fan is powered by 24 V DC from the main switch mode power supply. The heatsink fan and the door/top fan are powered by 48 V DC from a dedicated switch mode power supply on the power card. Each fan has tachometer feedback to the control card to confirm that the fan is operating correctly. On/off and speed control of the fans is provided to reduce overall acoustical noise and extend the life of the fans.

The following conditions activate fans on the D-frame:

- Output current greater than $60 \%$ of nominal
- IGBT over temperature
- IGBT low temperature
- Control card over temperature
- DC hold active
- DC brake active
- Dynamic brake circuit active
- During pre-magnetization of the motor
- AMA in progress

In addition to these conditions, the fans are always started shortly after mains input power is applied to the frequency converter. Once fans are started, they run for a minimum of one minute.

The following conditions activate fans on the E - and F frames:

## 1. AMA

2. DC Hold
3. Pre-Mag
4. DC Brake
5. $60 \%$ of nominal current is exceeded
6. Specific heatsink temperature exceeded (power size dependent)
7. Specific power card ambient temperature exceeded (power-size dependent)
8. Specific control card ambient temperature exceeded

## External Ducts

If more duct work is added externally to the Rittal cabinet the pressure drop in the ducting must be calculated. Use the derating charts to derate the frequency converter according to the pressure drop.

### 5.3 Electrical Installation

### 5.3.1 Cables General

## NOTICE

Always comply with national and local regulations on cable cross-sections.

For more information on the correct torques, see Table 5.9.

### 5.3.2 Preparing Gland Plates for Cables

1. Remove the gland plate from the frequency converter.
2. Provide support for the gland plate around the hole being punched or drilled.
3. Remove debris from the hole.
4. Mount the cable entry on the frequency converter.

### 5.3.3 Connection to Mains and Earthing

## NOTICE

The plug connector for power can be removed.

1. Make sure that the frequency converter is properly earthed. Connect to earth connection (terminal 95). Use screw from the accessory bag.
2. Place plug connector $91,92,93$ from the accessory bag onto the terminals labelled MAINS at the bottom of the frequency converter.
3. Connect mains wires to the mains plug connector.

## ACAUTION

The earth connection cable cross section must be at least $10 \mathrm{~mm}^{2}$ or 2 rated mains wires terminated separately according to EN 50178.

The mains connection is fitted to the main switch if included.

## NOTICE

Check that mains voltage corresponds to the mains voltage of the frequency converter name plate.

How to Install

## ACAUTION

## IT Mains

Do not connect 400 V frequency converters with RFI－ filters to mains supplies with a voltage between phase and earth of more than 440 V ．
For IT mains and delta earth（grounded leg），mains voltage can exceed 440 V between phase and earth．

Illustration 5．43 Terminals for Mains and Earthing

## 5．3．4 Motor Cable Connection

## NOTICE

Screened motor cable is recommended．If an unscreened cable is used，some EMC requirements are not complied with．For more information，see chapter 5．9 EMC－correct Installation．

1．Fasten de－coupling plate to the bottom of the frequency converter with screws and washers from the accessory bag．

2．Attach motor cable to terminals $96(\mathrm{U}), 97(\mathrm{~V}), 98$ （W）．

3．Connect to earth connection（terminal 99）on de－ coupling plate with screws from the accessory bag．

4．Insert terminals $96(\mathrm{U}), 97(\mathrm{~V}), 98(\mathrm{~W})$ and motor cable to terminals labelled MOTOR．
5．Fasten screened cable to de－coupling plate with screws and washers from the accessory bag．

All types of three－phase asynchronous standard motors can be connected to the frequency converter．Normally，small motors are star－connected（230／400 V，D／Y）．Large motors are delta－connected（ $400 / 690 \mathrm{~V}, \mathrm{D} / \mathrm{Y}$ ）．Refer to the motor name plate for correct connection mode and voltage．

Illustration 5．44 Motor Cable Connection

## NOTICE

If motors are not inverter－duty rated，fit a Sine－wave filter on the output of the frequency converter．

## 5．3．5 Motor Cables

See chapter 8．1 General Specifications for maximum dimensioning of motor cable cross－section and length．
－To comply with EMC emission specifications，use a screened／armoured motor cable．
－Keep the motor cable as short as possible to reduce the noise level and leakage currents．
－Connect the motor cable screen to both the de－ coupling plate of the frequency converter and to the metal cabinet of the motor．
－Make the screen connections with the largest possible surface area（cable clamp），by using the supplied installation devices in the frequency converter．
－Avoid mounting with twisted screen ends （pigtails），which spoils high frequency screening effects．
－If it is necessary to split the screen to install a motor isolator or motor relay，the screen must be
continued with the lowest possible HF impedance.

## F-frame requirements

F1/F3 requirements:
Motor phase cable quantities must be multiples of 2 , resulting in $2,4,6$, or 8 (one cable is not allowed) to obtain equal numbers of wires attached to both inverter module terminals. The cables are required to be equal length within $10 \%$ between the inverter module terminals and the first common point of a phase. The recommended common point is the motor terminals.

## F2/F4 requirements:

Motor phase cable quantities must be multiples of 3, resulting in $3,6,9$, or 12 ( 1 or 2 cables are not allowed) to obtain equal numbers of wires attached to each inverter module terminal. The wires are required to be equal length within 10\% between the inverter module terminals and the first common point of a phase. The recommended common point is the motor terminals.

## Output junction box requirements:

The length, minimum 2.5 meters, and quantity of cables must be equal from each inverter module to the common terminal in the junction box.

## NOTICE

If a retrofit application requires unequal numbers of wires per phase, consult the factory for requirements and documentation or use the top/bottom entry side cabinet busbar option.

### 5.3.6 Electrical Installation of Motor Cables

## Screening of cables

Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or motor contactor, the screen must be continued at the lowest possible HF impedance.

## Cable length and cross-section

The frequency converter has been tested with a given length of cable and a given cross-section of that cable. If the cross-section is increased, the cable capacitance - and thus the leakage current - increase, and the cable length must be reduced correspondingly.

## Switching frequency

When frequency converters are used together with Sinewave filters to reduce the acoustic noise from a motor, the switching frequency must be set according to the Sinewave filter instruction in 14-01 Switching Frequency.

## Aluminum conductors

Aluminum conductors are not recommended. Terminals can accept aluminum conductors but the conductor surface has to be clean, free of oxidation and sealed with neutral acid free Vaseline grease before the conductor is connected.

Furthermore, the terminal screw must be retightened after two days due to the softness of the aluminum. It is crucial to keep the connection a gas tight joint, otherwise the aluminum surface oxidizes again.

How to Install

### 5.3.7 Fuses

## NOTICE

All fuses mentioned are maximum fuse sizes.

## Branch circuit protection

To protect the installation against electrical and fire hazard, all branch circuits in an installation, switch gear or machine, must be short-circuit and overcurrent protected according to the national/international regulations.

## Short circuit protection

The frequency converter must be protected against short-circuit to avoid electrical or fire hazard. Danfoss recommends using the fuses mentioned in Table 5.7 and Table 5.8 to protect service personnel or other equipment in case of an internal failure. The frequency converter provides full short circuit protection in a short-circuit on the motor output.

## Over-current protection

To avoid fire hazard due to overheating of the cables, provide over-current protection in accordance with national regulations. The frequency converter is equipped with an internal over current protection that can be used for upstream overload protection (UL-applications excluded). See 4-18 Current Limit. Fuses must be designed for protection in a circuit capable of supplying a maximum of $100,000 \mathrm{~A}_{\mathrm{rms}}$ (symmetrical), $500 \mathrm{~V} / 600 \mathrm{~V}$ maximum.

3. 6-pole analog $\mathrm{I} / \mathrm{O}$
4. USB Connection

Illustration 5.45 Control Terminals (All Frame Sizes)

### 5.3.11 Control Cable Terminals

To mount the cable to the terminal:

1. Strip 9-10 mm of insulation from cable.
2. Insert a screw driver (Max. $0.4 \times 2.5 \mathrm{~mm}$ ) in the rectangular hole.
3. Insert the cable in the adjacent circular hole.
4. Remove the screw driver. The cable is now mounted to the terminal.

Control cable torque value is $0.5-0.6 \mathrm{Nm}$ ( $5 \mathrm{in}-\mathrm{lbs}$.)

To remove the cable from the terminal:

1. Insert a screw driver ${ }^{11}$ in the square hole.
2. Pull out the cable.

### 5.3.12 Basic Wiring Example

1. Mount terminals from the accessory bag to the front of the frequency converter.
2. Connect terminals 18 and 27 to +24 V (terminal 12/13)

Default settings:
18 = Start
27 = stop inverse

Illustration 5.50 Terminal 37 available with Safe Stop Function only!

### 5.3.13 Control Cable Length

## Digital in/digital out

Dependent on what electronics are being used, it is possible to calculate the maximum cable impedance based on the $4 \mathrm{k} \Omega$ frequency converter input impedance.

## Analog in/analog out

Again the electronics used puts a limitation on the cable length.

### 5.3.14 Electrical Installation, Control Cables

[^6]
*Safe Torque Off (STO) input available with STO function only

Very long control cables and analogue signals occasionally result in $50 / 60 \mathrm{~Hz}$ ground loops due to noise from mains supply cables. In this case, break the screen or insert a 100 nF capacitor between screen and chassis.

The digital and analogue inputs and outputs must be connected separately to the common inputs (terminal 20, 55,39 ) to avoid ground currents from both groups to affect other groups. For example, switching on the digital input disturbs the analogue input signal.

## NOTICE

## Control cables must be screened.

Use a clamp from the accessory bag to connect the screen to the frequency converter de-coupling plate for control cables.

### 5.3.16 Switches S201, S202 and S801

Switches S201 (A53) and S202 (A54) are used to select a current $(0-20 \mathrm{~mA})$ or a voltage $(0-10 \mathrm{~V})$ configuration of the analog input terminals 53 and 54 respectively.

Switch S801 (BUS TER.) can be used to enable termination on the RS-485 port (terminals 68 and 69).

See Illustration 5.51 and Illustration 5.52.

Default setting:

$$

### 5.4.1 Torque Settings

When tightening electrical connections, it is important to use a torque wrench to obtain the correct torque. Torque that is too low or too high results in a bad electrical connection.
See the torque settings in Table 5.9.

### 5.4.2 Power Connections

## NOTICE

All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. UL applications require $75^{\circ} \mathrm{C}$ copper conductors. Non-UL applications can use $75{ }^{\circ} \mathrm{C}$ and $90^{\circ} \mathrm{C}$ copper conductors.

The power cable connections are situated as shown in Illustration 5.59. Dimensioning of cable cross section must comply with the current ratings and local legislation. See chapter 8.1 General Specifications for correct dimensioning of motor cable cross-section and length.

For protection of the frequency converter, use the recommended fuses unless the unit has built-in fuses. Recommended fuses are listed in the Operating Instructions. Ensure that proper fusing complies with local regulations.

The mains connection is fitted to the mains switch if included.

Illustration 5.59 Power Cable Connections

## NOTICE

The motor cable must be screened/armoured. If an unscreened/unarmoured cable is used, some EMC requirements are not complied with. Use a screened/ armoured motor cable to comply with EMC emission specifications. For more information, see Table 2.1.

## Screening of cables

Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or contactor, continue the screen at the lowest possible HF impedance.

Connect the motor cable screen to both the de-coupling plate of the frequency converter and the metal housing of the motor.

Make the screen connections with the largest possible surface area (cable clamp) by using the installation devices within the frequency converter.

## Cable-length and cross-section

The frequency converter has been EMC tested with a given length of cable. Keep the motor cable as short as possible to reduce the noise level and leakage currents.

## Switching frequency

When frequency converters are used together with sinewave filters to reduce the acoustic noise from a motor, the switching frequency must be set according to the instructions in 14-01 Switching Frequency.

Table 5.10 Motor Cable Connection

1) Protected Earth Connection

## NOTICE

In motors without phase insulation, paper or other insulation reinforcement suitable for operation with voltage supply, fit a sine-wave filter on the output of the frequency converter.

## NOTICE

The power cables are heavy and difficult to bend. Consider the optimum position of the frequency converter to ensure easy cable installation. Each terminal allows use of up to 4 cables with cable lugs or use of standard box lugs. Ground is connected to a relevant termination point in the frequency converter.

### 5.4.3 Power Connections 12-Pulse Frequency Converters

## NOTICE

All cabling must comply with national and local regulations on cable cross-sections and ambient temperature. UL applications require $75^{\circ} \mathrm{C}$ copper conductors. Non-UL applications can use 75 and $90^{\circ} \mathrm{C}$ copper conductors.

The power cable connections are situated as shown in Illustration 5.89. Dimensioning of cable cross section must be done in accordance with the current ratings and local legislation. See for correct dimensioning of motor cable cross-section and length.

For protection of the frequency converter, use the recommended fuses unless the unit is fitted with built-in fuses. Recommended fuses can be seen in chapter 5.3.7 Fuses. Always ensure that fusing complies with local regulations.

The mains connection is fitted to the mains switch if included.

Illustration 5.89 Mains Connection

Illustration 5.90 Mains Connection Options for 12-Pulse Frequency Converters

## Notes:

1) Parallel connection shown. A single 3-phase cable may be used with sufficient carrying capability. Install shorting bus bars.
2) 6-pulse connection eliminates the harmonics reduction benefits of the 12-pulse rectifier.
3) Suitable for IT and TN mains connection.
4) If one of the 6-pulse modular rectifiers becomes inoperable, it is possible to operate the frequency converter at reduced load with a single 6-pulse rectifier. Contact Danfoss for reconnection details.
5) No paralleling of mains cabling is shown here. A 12-pulse frequency converter used as a 6-pulse should have mains cables of equal numbers and lengths.

How to Install

## NOTICE

Use mains cables of equal length ( $\mathbf{\pm 1 0 \%}$ ) and the same wire size for all 3 phases on both rectifier sections.

## Screening of cables

Avoid installation with twisted screen ends (pigtails). They spoil the screening effect at higher frequencies. If it is necessary to break the screen to install a motor isolator or motor contactor, the screen must be continued at the lowest possible HF impedance.

Connect the motor cable screen to both the de-coupling plate of the frequency converter and the metal housing of the motor.

Make the screen connections with the largest possible surface area (cable clamp) using the supplied installation devices within the frequency converter.

## Cable-Length and Cross-Section

Keep the motor cable as short as possible to reduce the noise level and leakage currents.

## Switching Frequency

When frequency converters are used together with sinewave filters to reduce the acoustic noise from a motor, set the switching frequency according to the instruction in 14-01 Switching Frequency.

## NOTICE

In motors without phase insulation paper or other insulation reinforcement suitable for operation with voltage supply, fit a sine-wave filter on the output of the frequency converter.

### 5.4.4 Shielding against Electrical Noise

## F-frame Size Units Only

Before mounting the mains power cable, mount the EMC metal cover to ensure best EMC performance.

## NOTICE

The EMC metal cover is only included in units with an RFI filter.

Illustration 5.91 Mounting of EMC Shield

### 5.4.5 External Fan Power Supply

## Frame Sizes E and F

In case the frequency converter is supplied by DC or if the fan must run independently of the mains supply, an external power supply can be connected via the power card.

The connector located on the power card provides the connection of line voltage for the cooling fans. The fans are connected at the factory to connect to a common AC line. Use jumpers between terminals 100-102 and 101-103. If external supply is needed, the jumpers are removed and the supply is connected to terminals 100 and 101 . Use a 5 A fuse for protection. In UL applications, use a LittelFuse KLK-5 or equivalent.

How to Install

### 5.6 Final Set-Up and Test

To test the set-up and ensure that the frequency converter is running, follow these steps.

Step 1. Locate the motor name plate.

## NOTICE

The motor is either star- $(\mathrm{Y})$ or delta- connected ( $\Delta$ ). This information is on the motor name plate data.

Step 2. Enter the motor name plate data in this parameter list.
To access this list, first press [Quick Menu], then select "Q2 Quick Setup"

1. 1-20 Motor Power [kW] or 1-21 Motor Power [HP]
2. 1-22 Motor Voltage
3. 1-23 Motor Frequency
4. 1-24 Motor Current
5. 1-25 Motor Nominal Speed

Step 3. Activate the Automatic Motor Adaptation (AMA).
Performing an AMA ensures optimum performance. The AMA measures the values from the motor model equivalent diagram.

1. Connect terminal 27 to terminal 12 or set 5-12 Terminal 27 Digital Input to [0] No function
2. Activate the AMA 1-29 Automatic Motor Adaptation (AMA).
3. Choose between complete or reduced AMA. If an LC filter is mounted, run only the reduced AMA, or remove the LC filter during the AMA procedure.
4. Press [OK]. The display shows "Press [Hand On] to start".
5. Press [Hand On]. A progress bar indicates whether the AMA is in progress.

## Stop the AMA during operation

1. Press [Off] - the frequency converter enters into alarm mode and the display shows that the AMA was terminated.

## Successful AMA

1. The display shows "Press [OK] to finish AMA".
2. Press $[O K]$ to exit the AMA state.

## Unsuccessful AMA

1. The frequency converter enters into alarm mode. A description of the alarm can be found in
chapter 8 General Specifications and Troubleshooting.
2. "Report Value" in the [Alarm Log] shows that the last measuring sequence carried out by the AMA, before the frequency converter entered alarm mode. This number along with the description of the alarm helps with troubleshooting. If contacting Danfoss Service, make sure to mention number and alarm description.

## NOTICE

AMA often fails because of incorrectly registered motor name plate data or too great a difference between the motor power size and the frequency converter power size.

Step 4. Set speed limit and ramp time.
Set up the desired limits for speed and ramp time.

1. 3-02 Minimum Reference
2. 3-03 Maximum Reference
3. 4-11 Motor Speed Low Limit [RPM] or 4-12 Motor Speed Low Limit [Hz]
4. 4-13 Motor Speed High Limit [RPM] or 4-14 Motor Speed High Limit [Hz]
5. 3-41 Ramp 1 Ramp Up Time
6. 3-42 Ramp 1 Ramp Down Time

### 5.7 Installation of Miscellaneous Connections

### 5.7.1 RS-485 Bus Connection

One or more frequency converters can be connected to a control (or master) using the RS-485 standardised interface. Terminal 68 is connected to the $P$ signal ( $T X+, R X+$ ), while terminal 69 is connected to the N signal (TX-, RX-).

If more than one frequency converter is connected to a master, use parallel connections.

Illustration 5.94 Parallel Connections

How to Install

To avoid potential equalising currents in the screen, earth the cable screen via terminal 61, which is connected to the frame via an RC-link.

For EMC correct installation, refer to chapter 5.9 EMCcorrect Installation.

## Bus termination

Terminate the RS-485 bus using a resistor network at both ends. For this purpose, set switch 8801 on the control card for "ON".
For more information, see chapter 5.3.16 Switches S201, S202 and S801.

Communication protocol must be set to 8-30 Protocol.

### 5.7.2 How to Connect a PC to the Unit

To control or program the frequency converter from a PC, install the MCT 10 Set-up Software.
The PC is connected via a standard (host/device) USB cable, or via the RS-485 interface.

## NOTICE

The USB connection is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals. The USB connection is connected to protection earth on the frequency converter. Use only isolated laptop as PC connection to the USB connector on the frequency converter.

Illustration 5.95 Connection of PC to Frequency Converter

### 5.7.3 PC Software Tools

All frequency converters are equipped with a serial communication port. A PC tool for communication between PC and frequency converter is available.

### 5.7.3.1 MCT 10

MCT 10 has been designed as an easy to use interactive tool for setting parameters in our frequency converters.
The MCT 10 Set-up Software is useful for:

- Planning a communication network off-line. MCT 10 contains a complete frequency converter database
- Commissioning frequency converters on line
- Saving settings for all frequency converters
- Replacing a frequency converter in a network
- Expanding an existing network
- Future developed frequency converters will be supported

## MCT 10

Set-up Software support Profibus DP-V1 via a Master class 2 connection, which makes it possible to on line read/write parameters in a frequency converter via the Profibus network, eliminating the need for an extra communication network.

## Save drive settings:

1. Connect a PC to the unit via USB com port
2. Open MCT 10 Set-up Software
3. Choose "Read from drive"
4. Choose "Save as"

All parameters are now stored in the PC.

## Load drive settings:

1. Connect a PC to the unit via USB com port
2. Open MCT 10 Set-up software
3. Choose "Open"- to view stored files
4. Open the appropriate file
5. Choose "Write to drive"

All parameter settings are now transferred to the frequency converter.
A separate manual for MCT 10 Set-up Software is available.

## The MCT 10 Set-up Software Modules

The following modules are included in the software package:

## MCT 10 Setup Software

- Setting parameters
- Copy to and from frequency converters
- Documentation and print out of parameter settings incl. diagrams

## Ext. User Interface

- Preventive Maintenance Schedule
- Clock settings
- Timed Action Programming

How to Install

- Smart Logic Controller Set-up
- Cascade Control Config. Tool

## Ordering number:

Order the CD containing MCT 10 Set-up Software using code number 130B1000.

MCT 10 can also be downloaded from www.danfoss.com/ BusinessAreas/DrivesSolutions/Softwaredownload/.

### 5.7.3.2 MCT 31

## MCT 31

The MCT 31 harmonic calculation PC tool enables easy estimation of the harmonic distortion in a given application. Both the harmonic distortion of Danfoss frequency converters as well as non-Danfoss frequency converters with additional harmonic reduction devices, such as Danfoss AHF filters and 12-18-pulse rectifiers, can be calculated.

### 5.8 Safety

### 5.8.1 High Voltage Test

Carry out a high voltage test by short-circuiting terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}, \mathrm{L}_{1}, \mathrm{~L}_{2}$, and $\mathrm{L}_{3}$. Energize maximum 2.15 kV DC for 380-500 V frequency converters and 2.525 kV DC for 525690 V frequency converters for one second between this short-circuit and the chassis.

## AWARNING

When running high voltage tests of the entire installation, interrupt the mains and motor connection if the leakage currents are too high.

### 5.8.2 Safety Earth Connection

The frequency converter has a high leakage current and must be earthed appropriately for safety reasons according to EN 50178.

## AWARNING

The earth leakage current from the frequency converter exceeds 3.5 mA . To ensure a good mechanical connection from the earth cable to the earth connection (terminal 95), the earth grounding must be reinforced in one of the following ways:

- earth ground wire of at least $10 \mathrm{~mm}^{2}$
- 2 separate earth ground wires both complying with the dimensioning rules

### 5.9 EMC-correct Installation

### 5.9.1 Electrical Installation - EMC Precautions

The following is a guideline to good engineering practice when installing frequency converters. Follow these guidelines in compliance with EN 61800-3 First environment. If the installation is in EN 61800-3 Second environment, industrial networks, or in an installation with its own transformer, deviation from these guidelines is allowed but not recommended. See also chapter 2.3.3 Danfoss Frequency Converter and CE Labelling, , , chapter 2.10.3 EMC Test Results (Emission) and .

## Good Engineering Practice to Ensure EMC-Correct Electrical Installation:

- Use only braided screened/armoured motor cables and braided screened control cables. The screen provides a minimum coverage of $80 \%$. The screen material must be metal, not limited to but typically copper, aluminum, steel, or lead. There are no special requirements for the mains cable.
- Installations using rigid metal conduits are not required to use screened cable, but the motor cable must be installed in conduit separate from the control and mains cables. Full connection of the conduit from the frequency converter to the motor is required. The EMC performance of flexible conduits varies a lot and information from the manufacturer must be obtained.
- Connect the screen conduit to earth at both ends for motor cables as well as for control cables. In some cases, it is not possible to connect the screen in both ends. If so, connect the screen at the frequency converter. See also chapter 5.3.3 Connection to Mains and Earthing.
- Avoid terminating the screen with twisted ends (pigtails). It increases the high frequency impedance of the screen, which reduces its effectiveness at high frequencies. Use low impedance cable clamps or EMC cable glands instead.
- Avoid using unscreened motor or control cables inside cabinets housing the frequency converter, whenever possible.

Leave the screen as close to the connectors as possible.

Illustration 5.96 shows an example of an EMC-correct electrical installation of an IP20 frequency converter. The
frequency converter is fitted in an installation cabinet with an output contactor and connected to a PLC, which is installed in a separate cabinet. Other ways of doing the installation could have just as good an EMC performance, provided the guidelines to engineering practice are followed.

If the installation is not carried out according to the guideline and if unscreened cables and control wires are used, some emission requirements are not complied with, although the immunity requirements are fulfilled. See chapter 2.10.3 EMC Test Results (Emission).

Illustration 5.96 EMC-Correct Electrical Installation of a Frequency Converter in Cabinet

How to Install

Illustration 5.97 Electrical Connection Diagram (6-Pulse Example Shown)

### 5.9.2 Use of EMC-Correct Cables

Danfoss recommends braided screened/armoured cables to optimise EMC immunity of the control cables and the EMC emission from the motor cables.

The cable's ability to reduce the incoming and outgoing radiation of electric noise depends on the transfer impedance $\left(Z_{T}\right)$. The cable's screen is normally designed to reduce the transfer of electric noise; however, a screen with a lower transfer impedance $\left(Z_{T}\right)$ value is the most effective.

Cable manufacturers rarely state transfer impedance $\left(Z_{T}\right)$, but it is often possible to estimate transfer impedance $\left(Z_{T}\right)$ by assessing the physical design of the cable. See Illustration 5.98.

Illustration 5.98 Transfer Impedance $\mathbf{Z}_{\mathbf{T}}$

### 5.9.3 Earthing of Screened/Armoured Control Cables

Generally speaking, control cables must be braided screened/armoured and the screen must be connected with a cable clampat both ends to the metal cabinet of the unit.

Illustration 5.99 indicates how correct earthing is carried out and what to do when in doubt.
a. Correct earthing

Control cables and cables for serial communication must be fitted with cable clamps at both ends to ensure the best possible electrical contact.
b. Wrong earthing

Do not use twisted cable ends (pigtails). They increase the screen impedance at high frequencies.
c. Protection regarding earth potential between PLC and frequency converter
If the earth potential between the frequency converter and the PLC is different, electric noise can occur that disturbs the entire system. Solve this problem by fitting an equalising cable next to the control cable. Minimum cable crosssection: $16 \mathrm{~mm}^{2}$.
d. For $50 / 60 \mathrm{~Hz}$ earth loops

If long control cables are used, $50 / 60 \mathrm{~Hz}$ earth loops are possible. Solve this problem by
connecting one end of the screen to earth via a 100 nF capacitor (keeping leads short).
e. Cables for serial communication

Eliminate low-frequency noise currents between two frequency converters by connecting one end of the screen to terminal 61. This terminal is connected to earth via an internal RC link. Use twisted-pair cables for reducing the differential mode interference between the conductors.

| PLC etc. |

Illustration 5.99 Earthing

### 5.10 Residual Current Device

Use RCD relays, multiple protective earthing, or earthing as extra protection to comply with local safety regulations. If an earth fault appears, a DC content could develop in the faulty current.
If RCD relays are used, local regulations must be observed. Relays must be suitable for protection of 3-phase equipment with a bridge rectifier and for a brief discharge on power-up see chapter 2.13 Earth Leakage Current for further information.

### 6.1.4 Automatic Motor Adaptation (AMA)

AMA is an algorithm to measure the electrical motor parameters on a motor at standstill, meaning that AMA itself does not supply any torque.
AMA is useful when commissioning systems and optimising the adjustment of the frequency converter to the applied motor. This feature is used where the default setting does not apply to the connected motor.
1-29 Automatic Motor Adaptation (AMA) allows a choice of complete AMA with determination of all electrical motor parameters or reduced AMA with determination of the stator resistance Rs only.
The duration of a total AMA varies from a few minutes on small motors to more than 15 minutes on large motors.

## Limitations and preconditions:

- For the AMA to determine the motor parameters optimally, enter the correct motor nameplate data in 1-20 Motor Power [kW] to 1-28 Motor Rotation Check.
- For the best adjustment of the frequency converter, carry out AMA on a cold motor. Repeated AMA runs could lead to a heating of the motor, which results in an increase of the
stator resistance, Rs. Normally, this increase is not critical.
- AMA can only be carried out if the rated motor current is minimum $35 \%$ of the rated output current of the frequency converter. AMA can be carried out on up to one oversize motor.
- It is possible to carry out a reduced AMA test with a Sine-wave filter installed. Avoid carrying out a complete AMA with a Sine-wave filter. If an overall setting is required, remove the Sine-wave filter while running a total AMA. After completion of the AMA, reinsert the Sine-wave filter.
- If motors are coupled in parallel, use only reduced AMA if any.
- Avoid running a complete AMA when using synchronous motors. If synchronous motors are applied, run a reduced AMA and manually set the extended motor data. The AMA function does not apply to permanent magnet motors.
- The frequency converter does not produce motor torque during an AMA. During an AMA, it is imperative that the application does not force the motor shaft to run, which is known to happen with wind milling in ventilation systems, for example. This disturbs the AMA function.
- AMA cannot be activated when running a PM motor (when 1-10 Motor Construction is set to [1] PM non-salient SPM).

The Smart Logic Control (SLC) is essentially a sequence of user-defined actions (see 13-52 SL Controller Action) executed by the SLC when the associated user-defined event (see 13-51 SL Controller Event) is evaluated as TRUE by the SLC.
Events and actions are each numbered and are linked in pairs called states, which means that when event [1] is fulfilled (attains the value TRUE), action [1] is executed. After this sequence, the conditions of event [2] will be evaluated and if evaluated TRUE, action [2]will be executed, and so on. Events and actions are placed in array parameters.

Only one event is evaluated at any time. If an event is evaluated as FALSE, nothing happens (in the SLC) during the present scan interval and no other events are evaluated, so that when the SLC starts, it evaluates event [1] (and only event [1]) each scan interval. Only when event [1] is evaluated TRUE, the SLC executes action [1] and starts evaluating event [2].

It is possible to program from 0 to 20 events and actions. When the last event/action has been executed, the sequence starts over again from event [1]/action [1]. The illustration shows an example with three events/actions:

Application Examples

In applications where a PLC is generating a simple sequence, the SLC takes over elementary tasks from the main control.
SLC is designed to act from event send to or generated in the frequency converter. The frequency converter then performs the pre-programmed action.

## Illustration 6.6 SLC Application Example

### 6.1.5 BASIC Cascade Controller

The BASIC Cascade Controller is used for pump applications where a certain pressure ("head") or level must be maintained over a wide dynamic range. Running a large pump at variable speed over a wide range is not an ideal solution because of low pump efficiency at lower speed. In a practical way, the limit is $25 \%$ of the rated full load speed for the pump.

In the BASIC Cascade Controller, the frequency converter controls a variable speed (lead) motor as the variable speed pump and can stage up to two additional constant speed pumps on and off. Connect the additional constant speed pumps directly to mains or via softstarters. By varying the speed of the initial pump, variable speed control of the entire system is provided, maintaining constant pressure while eliminating pressure surges, resulting in reduced system stress, and quieter operation in pumping systems.

130BA362.10

Illustration 6.7 BASIC Cascade Controller

## Fixed Lead Pump

The motors must be of equal size. The BASIC Cascade Controller allows the frequency converter to control up to three equal size pumps using the frequency converter's 2 built-in relays. When the variable pump (lead) is connected directly to the frequency converter, the 2 built-in relays control the other two pumps. When lead pump alternations are enabled, pumps are connected to the built-in relays and the frequency converter can operate 2 pumps.

Application Examples

## Lead Pump Alternation

The motors must be of equal size. This function makes it possible to cycle the frequency converter between the pumps in the system (maximum of two pumps). In this operation, the run time between pumps is equalised reducing the required pump maintenance and increasing reliability and lifetime of the system. The alternation of the lead pump can take place at a command signal or at staging (adding another pump).

The command can be a manual alternation or an alternation event signal. If the alternation event is selected, the lead pump alternation takes place every time the event occurs. Selections include whenever an alternation timer expires, at a predefined time of day or when the lead pump goes into sleep mode. The actual system load determines staging.

A separate parameter limits alternation only to take place if total capacity required is $>50 \%$. Total pump capacity is determined as lead pump plus fixed speed pumps capacities.

## Bandwidth Management

In cascade control systems, to avoid frequent switching of fixed speed pumps, the desired system pressure is kept within a bandwidth rather than at a constant level. The staging bandwidth provides the required bandwidth for operation. When a large and quick change in system pressure occurs, the override bandwidth overrides the staging bandwidth to prevent immediate response to a short duration pressure change. An override bandwidth timer can be programmed to prevent staging until the system pressure has stabilised and normal control established.
When the cascade controller is enabled and the drive issues a trip alarm, the system head is maintained by staging and destaging fixed speed pumps. To prevent frequent staging and destaging and minimise pressure fluctuations, a wider fixed speed bandwidth is used instead of the staging bandwidth.

### 6.1.6 Pump Staging with Lead Pump Alternation

With lead pump alternation enabled, a maximum of two pumps are controlled. At an alternation command, the PID stops, the lead pump ramps to minimum frequency ( $f_{\text {min }}$ ) and after a delay, it ramps to maximum frequency ( $f_{\max }$ ). When the speed of the lead pump reaches the de-staging frequency, the fixed speed pump is cut out (de-staged). The lead pump continues to ramp up and then ramps down to a stop and the 2 relays are cut out.

130BA364.10

Illustration 6.8 Lead Pump Alternation

After a time delay, the relay for the fixed speed pump cuts in (staged) and this pump becomes the new lead pump. The new lead pump ramps up to maximum speed and then down to minimum speed. When ramping down and reaching the staging frequency, the old lead pump is now cut in (staged) on the mains as the new fixed speed pump.

If the lead pump has been running at minimum frequency ( $f_{\text {min }}$ ) for a programmed amount of time, with a fixed speed pump running, the lead pump contributes little to the system. When programmed value of the timer expires, the lead pump is removed avoiding water heating problems.

### 6.1.7 System Status and Operation

If the lead pump goes into sleep mode, the function is displayed on the LCP. It is possible to alternate the lead pump on a sleep mode condition.

When the cascade controller is enabled, the operation status for each pump and the cascade controller is displayed on the LCP. Information displayed includes:

- Pumps Status, is a read out of the status for the relays assigned to each pump. The display shows pumps that are disabled, off, running on the frequency converter or running on the mains/ motor starter.
- Cascade Status, is a read out of the status for the Cascade Controller. The display shows that the Cascade Controller is disabled, all pumps are off, and emergency has stopped all pumps, all pumps are running, fixed speed pumps are being staged/de-staged and lead pump alternation is occurring.
- De-stage at no-flow ensures that all fixed speed pumps are stopped individually until the no-flow status disappears.

### 6.1.8 Cascade Controller Wiring Diagram

The wiring diagram shows an example with the built-in BASIC Cascade Controller with one variable speed pump (lead) and two fixed speed pumps, a $4-20 \mathrm{~mA}$ transmitter and System Safety Interlock.

### 6.1.9 Fixed Variable Speed Pump Wiring Diagram

Illustration 6.10 Fixed Variable Speed Pump Wiring Diagram

- K1 blocks for K2 via the mechanical interlock preventing mains to be connected to the output of the frequency converter (via K1).
- Auxiliary break contact on K1 prevents K3 to cut in.
- RELAY 2 controls contactor K4 for on/off control of the fixed speed pump.
- At alternation, both relays deenergise and now RELAY 2 are energised as the first relay.

### 6.1.10 Lead Pump Alternation Wiring Diagram

Illustration 6.11 Lead Pump Alternation Wiring Diagram

Every pump must be connected to 2 contactors (K1/K2 and K3/K4) with a mechanical interlock. Thermal relays or other motor protection devices must be applied according to local regulation and/or individual demands.

- RELAY 1 (R1) and RELAY 2 (R2) are the built-in relays in the frequency converter.
- When all relays are de-energized, the first built-in relay that is energized cuts in the contactor corresponding to the pump controlled by the relay. For example, RELAY 1 cuts in contactor K1, which becomes the lead pump.

## 7 RS-485 Installation and Set-up

### 7.1 Introduction

RS-485 is a 2-wire bus interface compatible with multi-drop network topology. Nodes can be connected as a bus, or via drop cables from a common trunk line. A total of 32 nodes can be connected to one network segment. Repeaters divide network segments. Note each repeater function as a node within the segment in which it is installed. Each node connected within a given network must have a unique node address, across all segments. Terminate each segment at both ends, using either the termination switch (S801) of the frequency converters or a biased termination resistor network. Always use screened twisted pair (STP) cable for bus cabling, and always follow good common installation practice.
Low-impedance earth connection of the screen at every node is important, including at high frequencies. Thus, connect a large surface of the screen to earth, e.g. with a cable clamp or a conductive cable gland. If necessary, apply potential-equalizing cables to maintain the same earth potential throughout the network. Particularly in installations with long cables.
To prevent impedance mismatch, always use the same type of cable throughout the entire network. When connecting a motor to the frequency converter, always use screened motor cable.

| Cable | Screened twisted pair (STP) |
| :--- | :--- |
| Impedance | $120 \Omega$ |
| Cable length | Max. $1,200 \mathrm{~m}$ (including drop lines) |

### 7.1.3 EMC Precautions

To achieve interference-free operation of the RS-485 network, the following EMC precautions are recommended.

Relevant national and local regulations, regarding protective earth connection, for example, must be observed. The RS-485 communication cable must be kept away from motor and brake resistor cables to avoid coupling of high-frequency noise from one cable to another. Normally a distance of $200 \mathrm{~mm}(8 \mathrm{in})$ is sufficient. However, in situations where cables run in parallel over long distances, keeping the greatest possible distance between cables is recommended. When crossing is
unavoidable, the RS-485 cable must cross motor and brake resistor cables at an angle of $90^{\circ}$.

Illustration 7.2 EMC Precautions

### 7.2 FC Protocol Overview

The FC protocol, also referred to as FC bus or Standard bus, is the Danfoss standard fieldbus. It defines an access technique according to the master-slave principle for communications via a serial bus.
One master and a maximum of 126 slaves can be connected to the bus. The master selects the individual slaves via an address character in the telegram. A slave itself can never transmit without first being requested to do so, and direct message transfer between the individual slaves is not possible. Communications occur in the halfduplex mode.
The master function cannot be transferred to another node (single-master system).

The physical layer is RS-485, thus utilising the RS-485 port built into the frequency converter. The FC protocol supports different telegram formats:

- A short format of 8 bytes for process data.
- A long format of 16 bytes that also includes a parameter channel.
- A format used for texts.

### 7.2.1 Modbus RTU

The FC protocol provides access to the control word and bus reference of the frequency converter.

The control word allows the Modbus master to control several important functions of the frequency converter:

- Start
- Stop of the frequency converter in various ways: Coast stop Quick stop DC Brake stop Normal (ramp) stop
- Reset after a fault trip
- Run at various preset speeds
- Run in reverse
- Change of the active set-up
- Control of the two relays built into the frequency converter

The bus reference is commonly used for speed control. It is also possible to access the parameters, read their values, and where possible, write values to them, permitting a range of control options, including controlling the setpoint of the frequency converter when its internal PID controller is used.

### 7.3 Network Connection

One or more frequency converters can be connected to a control (or master) using the RS-485 standardised interface. Terminal 68 is connected to the P signal ( $\mathrm{TX}+$, $\mathrm{RX}+$ ), while terminal 69 is connected to the N signal (TX-, RX-). See illustrations in chapter 5.9.3 Earthing of Screened/Armoured Control Cables

If more than one frequency converter is connected to a master, use parallel connections.

Illustration 7.3 Parallel Connections

To avoid potential equalising currents in the screen, earth the cable screen via terminal 61 , which is connected to the frame via an RC-link.

Illustration 7.4 Control Card Terminals

### 7.4 FC Protocol Message Framing Structure

### 7.4.1 Content of a Character (Byte)

Each character transferred begins with a start bit. Then 8 data bits are transferred, each corresponding to a byte. Each character is secured via a parity bit. This bit is set at " 1 " when it reaches parity. Parity is when there is an equal number of 1 characters in the 8 data bits and the parity bit in total. A stop bit completes a character, thus consisting of 11 bits in all.

Illustration 7.5 Character (Byte)

### 7.4.2 Telegram Structure

Each telegram has the following structure:

1. Start character $(S T X)=02$ Hex
2. A byte denoting the telegram length (LGE)
3. A byte denoting the frequency converter address (ADR)
A number of data bytes (variable, depending on the type of telegram) follows.

A data control byte ( BCC ) completes the telegram.

Illustration 7.6 Telegram Structure

### 7.4.3 Telegram Length (LGE)

The telegram length is the number of data bytes plus the address byte ADR and the data control byte BCC.

- $\quad$ The length of telegrams with 4 data bytes is LGE $=4+1+1=6$ bytes
- The length of telegrams with 12 data bytes is LGE $=12+1+1=14$ bytes
- The length of telegrams containing texts is $10^{1)}+\mathrm{n}$ bytes

1) The 10 represents the fixed characters, while the " $n$ "" is variable (depending on the length of the text).

### 7.4.4 Frequency Converter Address (ADR)

Two different address formats are used.
The address range of the frequency converter is either 131 or 1-126.

## 1. Address format 1-31:

Bit 7=0 (address format 1-31 active)
Bit 6 is not used
Bit 5=1: Broadcast, address bits (0-4) are not used
Bit 5=0: No Broadcast
Bit 0-4=frequency converter address 1-31
2. Address format 1-126:

> Bit $7=1$ (address format $1-126$ active)
> Bit $0-6=$ frequency converter address $1-126$
> Bit $0-6=0$ Broadcast

The follower returns the address byte unchanged to the master in the response telegram.

### 7.4.5 Data Control Byte (BCC)

The checksum is calculated as an XOR-function. Before the first byte in the telegram is received, the Calculated Checksum is 0 .

### 7.4.6 The Data Field

The structure of data blocks depends on the type of telegram. There are 3 types, and the type applies for both control telegrams (master $\Rightarrow$ follower) and response telegrams (follower $\Rightarrow$ master).

The 3 types of telegram are:

## Process block (PCD)

The PCD is made up of a data block of 4 bytes ( 2 words) and contains:

- Control word and reference value (from master to follower)
- Status word and present output frequency (from follower to master)

## Illustration 7.7 PCD

## Parameter block

The parameter block is used to transfer parameters between master and follower. The data block is made up of 12 bytes ( 6 words) and also contains the process block.

## Illustration 7.8 Parameter Block

## Text block

The text block is used to read or write texts via the data block.

### 7.4.8 Parameter Number (PNU)

Bits no. 0-11 transfer parameter numbers. The function of the relevant parameter is defined in the parameter description in the Programming Guide.

### 7.4.9 Index (IND)

The index is used together with the parameter number to read/write-access parameters with an index, for example, 15-30 Alarm Log: Error Code. The index consists of a low byte and a high byte.

Only the low byte is used as an index.

### 7.4.10 Parameter Value (PWE)

The parameter value block consists of 2 words ( 4 bytes), and the value depends on the defined command (AK). The master prompts for a parameter value when the PWE block contains no value. To change a parameter value (write), write the new value in the PWE block and send from the master to the follower.

When a follower responds to a parameter request (read command), the present parameter value in the PWE block is transferred and returned to the master. If a parameter contains not a numerical value but several data options, for example, 0-01 Language [0] English, and [4] Danish, select the data value by entering the value in the PWE

block. Serial communication is only capable of reading parameters containing data type 9 (text string).

15-40 FC Type to 15-53 Power Card Serial Number contain data type 9.
For example, read the unit size and mains voltage range in 15-40 FC Type. When a text string is transferred (read), the length of the telegram is variable, and the texts are of different lengths. The telegram length is defined in the second byte of the telegram, LGE. When using text transfer, the index character indicates whether it is a read or a write command.

To read a text via the PWE block, set the parameter command (AK) to 'F' Hex. The index character high-byte must be " 4. ."

Some parameters contain text that can be written via the serial bus. To write a text via the PWE block, set the parameter command (AK) to ' $F$ ' Hex. The index characters high-byte must be " 5 ."

### 7.4.12 Conversion

The various attributes of each parameter are displayed in the section factory settings. Parameter values are transferred as whole numbers only. Conversion factors are therefore used to transfer decimals.

4-12 Motor Speed Low Limit [Hz] has a conversion factor of 0.1 .

To preset the minimum frequency to 10 Hz , transfer the value 100. A conversion factor of 0.1 means that the value transferred is multiplied by 0.1. The value 100 is thus perceived as 10.0.

## Examples:

$0 \mathrm{~s} \Rightarrow$ conversion index 0
$0.00 \mathrm{~s} \Rightarrow$ conversion index -2
$0 \mathrm{~ms} \Rightarrow$ conversion index -3
$0.00 \mathrm{~ms} \Rightarrow$ conversion index -5

### 7.5.1 Writing a Parameter Value

Change 4-14 Motor Speed High Limit [Hz] to 100 Hz . Write the data in EEPROM.

PKE=E19E Hex - Write single word in 4-14 Motor Speed High Limit [Hz]
IND=0000 Hex
PWEhigh $=0000$ Hex
PWE ${ }_{\text {low }}=03 E 8$ Hex - Data value 1,000 , corresponding to 100 Hz , see chapter 7.4.12 Conversion.

## NOTICE

4-14 Motor Speed High Limit [Hz] is a single word, and the parameter command for write in EEPROM is "E."
Parameter number 4-14 is 19E in hexadecimal.

3-41 Ramp 1 Ramp Up Time is of the type Unsigned 32.

### 7.6 Modbus RTU Overview

### 7.6.1 Assumptions

Danfoss assumes that the installed controller supports the interfaces in this manual, and strictly observes all requirements and limitations stipulated in the controller and frequency converter.

### 7.6.2 Prerequisite Knowledge

The Modbus RTU (Remote Terminal Unit) is designed to communicate with any controller that supports the interfaces defined in this document. It is assumed that the reader has full knowledge of the capabilities and limitations of the controller.

### 7.6.3 Modbus RTU Overview

Regardless of the type of physical communication networks, the Modbus RTU Overview describes the process a controller uses to request access to another device. This process includes how the Modbus RTU responds to requests from another device, and how errors are detected and reported. It also establishes a common format for the layout and contents of message fields.
During communications over a Modbus RTU network, the protocol determines:

- How each controller learns its device address
- Recognises a message addressed to it
- Determines which actions to take
- Extracts any data or other information contained in the message
If a reply is required, the controller constructs the reply message and sends it.
Controllers communicate using a master-follower technique in which only one device (the master) can initiate transactions (called queries). The other devices (slaves) respond by supplying the requested data to the master, or by responding to the the query.
The master can address individual slaves, or can initiate a broadcast message to all slaves. Slaves return a message, called a response, to queries that are addressed to them individually. No responses are returned to broadcast

RS-485 Installation and Set...
queries from the master. The Modbus RTU protocol establishes the format for the master query by placing into it the device (or broadcast) address, a function code defining the requested action, any data to send, and an error-checking field. The follower response message is also constructed using Modbus protocol. It contains fields confirming the action taken, any data to return, and an error-checking field. If an error occurs in receipt of the message, or if the follower is unable to perform the requested action, the follower constructs an error message, and send it in response, or a time-out occurs.

### 7.6.4 Frequency Converter with Modbus RTU

The frequency converter communicates in Modbus RTU format over the built-in RS-485 interface. Modbus RTU provides access to the control word and bus reference of the frequency converter.

The control word allows the Modbus master to control several important functions of the frequency converter:

- Start
- Stop of the frequency converter in various ways: Coast stop
Quick stop
DC Brake stop
Normal (ramp) stop
- Reset after a fault trip
- Run at various preset speeds
- Run in reverse
- Change the active set-up
- Control the built-in relay of the frequency converter

The bus reference is commonly used for speed control. It is also possible to access the parameters, read their values, and, where possible, write values to them, permitting a range of control options, including controlling the setpoint of the frequency converter when its internal PI controller is used.

### 7.7 Network Configuration

### 7.7.1 Frequency Converter with Modbus RTU

To enable Modbus RTU on the frequency converter, set the following parameters:

| Parameter | Setting |
| :--- | :--- |
| $8-30$ Protocol | Modbus RTU |
| $8-31$ Address | $1-247$ |
| $8-32$ Baud Rate | $2400-115200$ |
| $8-33$ Parity / Stop Bits | Even parity, 1 stop bit (default) |

### 7.8 Modbus RTU Message Framing Structure

### 7.8.1 Frequency Converter with Modbus RTU

The controllers are set up to communicate on the Modbus network using RTU (Remote Terminal Unit) mode, with each byte in a message containing 24 -bit hexadecimal characters. The format for each byte is shown in Table 7.9.

| Start <br> bit | Data byte |  |  |  |  |  | Stop/ <br> Parity | Stop |  |  |

### 7.8.2 Modbus RTU Message Structure

The transmitting device places a Modbus RTU message into a frame with a known beginning and ending point. Receiving devices are able to begin at the start of the message, read the address portion, determine which device is addressed (or all devices, if the message is broadcast), and to recognise when the message is completed. Partial messages are detected and errors set as a result. Characters for transmission must be in hexadecimal 00 to FF format in each field. The frequency converter continuously monitors the network bus, also during 'silent' intervals. When the first field (the address

RS-485 Installation and Set...
field) is received, each frequency converter or device decodes it to determine which device is being addressed. Modbus RTU messages addressed to zero are broadcast messages. No response is permitted for broadcast messages. A typical message frame is shown in Table 7.11.

| Start | Address | Function | Data | CRC <br> check | End |
| :---: | :---: | :---: | :---: | :---: | :---: |
| T1-T2-T3- <br> T4 | 8 bits | 8 bits | $\mathrm{N} \times 8$ <br> bits | 16 bits | T1-T2-T3- <br> T4 |

Table 7.11 Typical Modbus RTU Message Structure

### 7.8.3 Start/Stop Field

Messages start with a silent period of at least 3.5 character intervals, implemented as a multiple of character intervals at the selected network baud rate (shown as Start T1-T2-T3-T4). The first transmitted field is the device address. Following the last transmitted character, a similar period of at least 3.5 character intervals marks the end of the message. A new message can begin after this period. The entire message frame must be transmitted as a continuous stream. If a silent period of more than 1.5 character intervals occurs before completion of the frame, the receiving device flushes the incomplete message and assumes that the next byte is the address field of a new message. Similarly, if a new message begins before 3.5 character intervals after a previous message, the receiving device considers it a continuation of the previous message, causing a time-out (no response from the follower), since the value in the final CRC field is not valid for the combined messages.

### 7.8.4 Address Field

The address field of a message frame contains 8 bits. Valid follower device addresses are in the range of $0-247$ decimal. The individual follower devices are assigned addresses in the range of $1-247$. ( 0 is reserved for broadcast mode, which all slaves recognise.) A master addresses a follower by placing the follower address in the address field of the message. When the follower sends its response, it places its own address in this address field to let the master know which follower is responding.

### 7.8.5 Function Field

The function field of a message frame contains 8 bits. Valid codes are in the range of 1-FF. Function fields are used to send messages between master and follower. When a message is sent from a master to a follower device, the function code field tells the follower what action to perform. When the follower responds to the master, it uses the function code field to indicate either a normal (errorfree) response, or that an error has occurred (called an exception response). For a normal response, the follower
simply echoes the original function code. For an exception response, the follower returns a code that is equivalent to the original function code with its most significant bit set to logic 1. In addition, the follower places a unique code into the data field of the response message. This code tells the master what error occurred, or the reason for the exception. See chapter 7.8.9 Function Codes Supported by Modbus RTU.

### 7.8.6 Data Field

The data field is constructed using sets of 2 hexadecimal digits, in the range of 00 to FF hexadecimal. These sequences are made up of one RTU character. The data field of messages sent from a master to follower device contains more information, which the follower must use to do what is defined by the function code. This information can include items such as coil or register addresses, the quantity of items, and the count of actual data bytes in the field.

### 7.8.7 CRC Check Field

Messages include an error-checking field, operating based on a Cyclical Redundancy Check (CRC) method. The CRC field checks the contents of the entire message. It is applied regardless of any parity check method used for the individual characters of the message. The transmitting device calculates the CRC value then appends the CRC as the last field in the message. The receiving device recalculates a CRC during receipt of the message and compares the calculated value to the actual value received in the CRC field. If the 2 values are unequal, a bus time-out results. The error-checking field contains a 16-bit binary value implemented as 28 -bit bytes. After error-checking, the low-order byte of the field is appended first, followed by the high-order byte. The CRC high-order byte is the last byte sent in the message.

## Design Guide

### 7.8.8 Coil Register Addressing

In Modbus, all data are organised in coils and holding registers. Coils hold a single bit, whereas holding registers hold a 2 byte word ( 16 bits). All data addresses in Modbus messages are referenced to zero. The first occurrence of a data item is addressed as item number zero. For example: The coil known as 'coil 1' in a programmable controller is addressed as coil 0000 in the data address field of a Modbus message. Coil 127 decimal is addressed as coil 007EHEX ( 126 decimal). Holding register 40001 is addressed as register 0000 in the data address field of the message. The function code field already specifies a 'holding register' operation. Therefore, the ' 4 XXXX' reference is implicit. Holding register 40108 is addressed as register 006BHEX (107 decimal).

### 7.8.10 Database Error Codes

In the event of an error, the following error codes may appear in the data field of a response message. For a full explanation of the structure of an exception (error) response, refer to chapter 7.8.5 Function Field.

| Error Code in data field <br> (decimal) | Database Error Code description |
| :--- | :--- |
| 00 | The parameter number does not exist |
| 01 | There is no write access to the parameter |
| 02 | The data value exceeds the parameter limits |
| 03 | The sub-index in use does not exist |
| 04 | The parameter is not of the array type |
| 05 | The data type does not match the parameter called |
| 06 | Only reset |
| 07 | Not changeable |

### 7.9 How to Access Parameters

### 7.9.1 Parameter Handling

The PNU (Parameter Number) is translated from the register address contained in the Modbus read or write message. The parameter number is translated to Modbus as (10xparameter number) DECIMAL.

### 7.9.2 Storage of Data

The Coil 65 decimal determines whether data written to the frequency converter is stored in EEPROM and RAM (coil $65=1$ ) or only in RAM (coil 65=0).

### 7.9.3 IND

The array index is set in holding register 9 and used when accessing array parameters.

### 7.9.4 Text Blocks

Parameters stored as text strings are accessed in the same way as the other parameters. The maximum text block size is 20 characters. If a read request for a parameter is for more characters than the parameter stores, the response is truncated. If the read request for a parameter is for fewer characters than the parameter stores, the response is space filled.

### 7.9.5 Conversion Factor

The different attributes for each parameter can be seen in the section on factory settings. Since a parameter value can only be transferred as a whole number, a conversion factor must be used to transfer decimals.

### 7.9.6 Parameter Values

## Standard data types

Standard data types are int16, int32, uint8, uint16, and uint32. They are stored as $4 x$ registers (40001-4FFFF). The parameters are read using function 03 HEX "Read Holding Registers." Parameters are written using the function 6 HEX "Preset Single Register" for 1 register (16-bits), and the function 10 HEX "Preset Multiple Registers" for 2 registers ( 32 -bits). Readable sizes range from 1 register ( 16 bits) up to 10 registers ( 20 characters).

## Non-standard data types

Non-standard data types are text strings and are stored as $4 x$ registers (40001-4FFFF). The parameters are read using function 03 HEX "Read Holding Registers" and written using function 10 HEX "Preset Multiple Registers." Readable sizes range from 1 register ( 2 characters) up to 10 registers (20 characters).

### 7.10 Examples

### 7.10.1 Read Coil Status (01 HEX)

## Description

This function reads the ON/OFF status of discrete outputs (coils) in the frequency converter. Broadcast is never supported for reads.

## Query

The query message specifies the starting coil and quantity of coils to read. Coil addresses start at zero.

Example of a request to read coils 33-48 (Status Word) from slave device 01 .

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 (frequency converter address) |
| Function | 01 (read coils) |
| Starting Address HI | 00 |
| Starting Address LO | 20 (32 decimals) Coil 33 |
| No. of Points HI | 00 |
| No. of Points LO | 10 (16 decimals) |
| Error Check (CRC) | - |

Table 7.19 Query

## Response

The coil status in the response message is packed as one coil per bit of the data field. Status is indicated as: $1=\mathrm{ON}$; $0=$ OFF. The LSB of the first data byte contains the coil addressed in the query. The other coils follow toward the high-order end of this byte, and from 'low order to high order' in subsequent bytes.
If the returned coil quantity is not a multiple of eight, the remaining bits in the final data byte are padded with zeros (toward the high-order end of the byte). The Byte Count field specifies the number of complete bytes of data.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 (frequency converter address) |
| Function | 01 (read coils) |
| Byte Count | 02 (2 bytes of data) |
| Data (Coils 40-33) | 07 |
| Data (Coils 48-41) | 06 (STW=0607hex) |
| Error Check (CRC) | - |

Table 7.20 Response

## NOTICE

Coils and registers are addressed explicit with an off-set of -1 in Modbus.
Coil 33 is addressed as Coil 32, for example.

RS-485 Installation and Set...

### 7.10.2 Force/Write Single Coil (05 HEX)

## Description

This function forces the coil to either ON or OFF. When broadcast, the function forces the same coil references in all attached slaves.

## Query

The query message specifies the coil 65 (parameter write control) to be forced. Coil addresses start at zero. Force Data $=00$ OOHEX (OFF) or FF OOHEX (ON).

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 (frequency converter address) |
| Function | 05 (write single coil) |
| Coil Address HI | 00 |
| Coil Address LO | 40 (64 decimal) Coil 65 |
| Force Data HI | FF |
| Force Data LO | 00 (FF 00 = ON) |
| Error Check (CRC) | - |

Table 7.21 Query

## Response

The normal response is an echo of the query, returned after the coil state has been forced.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 |
| Function | 05 |
| Force Data HI | FF |
| Force Data LO | 00 |
| Quantity of Coils HI | 00 |
| Quantity of Coils LO | 01 |

## Table 7.22 Response

### 7.10.3 Force/Write Multiple Coils (OF HEX)

This function forces each coil in a sequence of coils to either ON or OFF. When broadcast, the function forces the same coil references in all attached slaves.

The query message specifies the coils 17-32 (speed setpoint) to be forced.

## NOTICE

Coil addresses start at zero, so coil 17 is addressed as 16 , for example.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 (frequency converter address) |
| Function | 0 F (write multiple coils) |
| Coil Address HI | 00 |
| Coil Address LO | 10 (coil address 17) |
| Quantity of Coils HI | 00 |
| Quantity of Coils LO | 10 (16 coils) |
| Byte Count | 02 |
| Force Data HI <br> (Coils 8-1) | 20 |
| Force Data LO <br> (Coils 16-9) | 00 (ref. $=2000$ hex) |
| Error Check (CRC) | - |

Table 7.23 Query

## Response

The normal response returns the slave address, function code, starting address, and quantity of coils forced.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 (frequency converter address) |
| Function | 0 F (write multiple coils) |
| Coil Address HI | 00 |
| Coil Address LO | 10 (coil address 17) |
| Quantity of Coils HI | 00 |
| Quantity of Coils LO | 10 (16 coils) |
| Error Check (CRC) | - |

### 7.10.4 Read Holding Registers (03 HEX)

## Description

This function reads the contents of holding registers in the slave.

## Query

The query message specifies the starting register and quantity of registers to read. Register addresses start at zero, that is, registers 1-4 are addressed as 0-3.

Example: Read 3-03 Maximum Reference, register 03030.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 |
| Function | 03 (read holding registers) |
| Starting Address HI | 0 B (Register address 3029) |
| Starting Address LO | D5 (Register address 3029) |
| No. of Points HI | 00 |
| No. of Points LO | 02 - (Par. 3-03 is 32 bits long, <br> that is, 2 registers) |
| Error Check (CRC) | - |

Table 7.25 Query

## Response

The register data in the response message are packed as 2 bytes per register, with the binary contents right justified within each byte. For each register, the first byte contains

RS-485 Installation and Set...
the high-order bits and the second contains the low-order bits.

Example: Hex $0016 \mathrm{E} 360=1.500 .000=1,500$ RPM.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 |
| Function | 03 |
| Byte Count | 04 |
| Data HI <br> (Register 3030) | 00 |
| Data LO <br> (Register 3030) | 16 |
| Data HI <br> (Register 3031) | E3 |
| Data LO <br> (Register 3031) | 60 |
| Error Check <br> (CRC) | - |

Table 7.26 Response

### 7.10.5 Preset Single Register (06 HEX)

## Description

This function presets a value into a single holding register.

## Query

The query message specifies the register reference to be preset. Register addresses start at zero, that is, register 1 is addressed as 0 .

Example: Write to 1-00 Configuration Mode, register 1000.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 |
| Function | 06 |
| Register Address HI | 03 (Register address 999) |
| Register Address LO | E7 (Register address 999) |
| Preset Data HI | 00 |
| Preset Data LO | 01 |
| Error Check (CRC) | - |

Table 7.27 Query

## Response

The normal response is an echo of the query, returned after the register contents have been passed.

| Field Name | Example (HEX) |
| :--- | :--- |
| Slave Address | 01 |
| Function | 06 |
| Register Address HI | 03 |
| Register Address LO | E7 |
| Preset Data HI | 00 |
| Preset Data LO | 01 |
| Error Check (CRC) | - |

## Explanation of the control bits

 Bits 00/01Bits 00 and 01 are used to select between the 4 reference values, which are pre-programmed in 3-10 Preset Reference according to Table 7.29.

| Programmed <br> reference value | Parameter | Bit 01 | Bit 00 |

Table 7.29 Control Bits

Table 7.28 Response

## NOTICE

Make a selection in 8-56 Preset Reference Select to define how Bit 00/01 gates with the corresponding function on the digital inputs.

## Bit 02, DC brake

Bit 02='0' leads to DC braking and stop. Set braking current and duration in 2-01 DC Brake Current and 2-02 DC Braking Time.
Bit $02={ }^{\prime} 1^{\prime}$ leads to ramping.
Bit 03, Coasting
Bit 03='0': The frequency converter immediately "lets go" of the motor (the output transistors are "shut off") and it coasts to a standstill.
Bit $03=$ ' 1 ': The frequency converter starts the motor if the other starting conditions are met.

Make a selection in 8-50 Coasting Select to define how Bit 03 gates with the corresponding function on a digital input.

## Bit 04, Quick stop

Bit 04='0': Makes the motor speed ramp down to stop (set in 3-81 Quick Stop Ramp Time).
Bit 05, Hold output frequency
Bit $05==^{\prime} 0^{\prime}$ : The present output frequency (in Hz ) freezes. Change the frozen output frequency only with the digital inputs (5-10 Terminal 18 Digital Input to 5-15 Terminal 33 Digital Input) programmed to Speed up and Slow down.

## NOTICE

If freeze output is active, only the following conditions can stop the frequency converter:

- Bit 03 Coasting stop.
- Bit 02 DC braking.
- Digital input (5-10 Terminal 18 Digital Input to 5-15 Terminal 33 Digital Input) programmed to DC braking, Coasting stop, or Reset and coasting stop.

## Bit 06, Ramp stop/start

Bit 06='0': Causes a stop and makes the motor speed ramp down to stop via the selected ramp down parameter. Bit 06='1': Permits the frequency converter to start the motor, if the other starting conditions are met.

Make a selection in 8 -53 Start Select to define how Bit 06 Ramp stop/start gates with the corresponding function on a digital input.

## Bit 07, Reset

Bit 07='0': No reset.
Bit $07=^{\prime} 1^{\prime}$ : Resets a trip. Reset is activated on the leading edge of the signal, that is, when changing from logic ' 0 ' to logic '1'.

Bit 08, Jog
Bit $08={ }^{\prime} 1$ ': The output frequency depends on3-19 Jog Speed [RPM].
Bit 09, Selection of ramp $1 / 2$
Bit 09="0": Ramp 1 is active (3-41 Ramp 1 Ramp Up Time to 3-42 Ramp 1 Ramp Down Time).
Bit 09="1": Ramp 2 (3-51 Ramp 2 Ramp Up Time to 3-52 Ramp 2 Ramp Down Time) is active.

## Bit 10, Data not valid/Data valid

Tell the frequency converter whether to use or ignore the control word. Bit $10=^{\prime} 0^{\prime}$ : The control word is ignored. Bit $10=^{\prime} 1^{\prime}$ : The control word is used. This function is relevant because the telegram always contains the control word, regardless of the telegram type. Thus, it is possible to turn off the control word if not in use when updating or reading parameters.
Bit 11, Relay 01
Bit 11="0": Relay not activated.
Bit 11="1": Relay 01 activated if Control word bit 11 is chosen in 5-40 Function Relay.

## Bit 12, Relay 04

Bit $12=$ " 0 ": Relay 04 is not activated.
Bit $12=121$ ": Relay 04 is activated if Control word bit 12 is chosen in 5-40 Function Relay.

Bit $13 / 14$, Selection of set-up
Use bits 13 and 14 to select from the 4 menu set-ups according to Table 7.30.

| Set-up | Bit 14 | Bit 13 |
| :---: | :---: | :---: |
| 1 | 0 | 0 |
| 2 | 0 | 1 |
| 3 | 1 | 0 |
| 4 | 1 | 1 |

Table 7.30 Selection of Set-Up

The function is only possible when Multi Set-Ups is selected in 0-10 Active Set-up.
Make a selection in 8-55 Set-up Select to define how Bit $13 / 14$ gates with the corresponding function on the digital inputs.

## Bit 15 Reverse

Bit $15==^{\prime} 0^{\prime}$ : No reversing.
Bit $15=^{\prime} 1^{\prime}$ : Reversing. In the default setting, reversing is set to digital in 8-54 Reversing Select. Bit 15 causes reversing only when Ser. communication, Logic, or Logic and is selected.

### 7.11.2 Status Word According to FC Profile

| 12 | Drive OK | Stopped, auto start |
| 13 | Voltage OK | Voltage exceeded |
| 14 | Torque OK | Torque exceeded |
| 15 | Timer OK | Timer exceeded |

## Explanation of the status bits

## Bit 00, Control not ready/ready

Bit $00={ }^{\prime} 0^{\prime}$ : The frequency converter trips.
Bit $00==^{\prime} 1$ : The frequency converter controls are ready but the power component does not necessarily receive any power supply (in case of external 24 V supply to controls).

## Bit 01, Drive ready

Bit $01=$ ' 1 ': The frequency converter is ready for operation but the coasting command is active via the digital inputs or via serial communication.

## Bit 02, Coasting stop

Bit $02={ }^{\prime} 0$ ': The frequency converter releases the motor.
Bit $02=^{\prime} 1^{\prime}$ : The frequency converter starts the motor with a start command.

## Bit 03, No error/trip

Bit 03='0': The frequency converter is not in fault mode. Bit $03==^{\prime} 1$ : The frequency converter trips. To re-establish operation, enter [Reset].

## Bit 04, No error/error (no trip)

Bit 04='0': The frequency converter is not in fault mode. Bit 04=" 1 ": The frequency converter shows an error but does not trip.

## Bit 05, Not used

Bit 05 is not used in the status word.

## Bit 06, No error/triplock

Bit $06==^{\prime} 0$ : The frequency converter is not in fault mode.
Bit $06=" 1$ ": The frequency converter is tripped and locked.
Bit 07, No warning/warning
Bit $07==^{\prime} 0^{\prime}$ : There are no warnings.
Bit 07='1': A warning has occurred.

## Bit 08, Speed $\neq$ reference/speed=reference

Bit $08={ }^{\prime} 0^{\prime}$ : The motor is running but the present speed is different from the preset speed reference. It could be the case when the speed ramps up/down during start/stop. Bit $08==^{\prime} 1$ ': The motor speed matches the preset speed reference.

## Bit 09, Local operation/bus control

Bit 09='0': [Stop/Reset] is activated on the control unit or Local control in 3-13 Reference Site is selected. The frequency converter cannot be controlled via serial communication.
Bit $09=^{\prime} 1^{\prime}$ It is possible to control the frequency converter via the fieldbus/serial communication.

## Bit 10, Out of frequency limit

Bit $10={ }^{\prime} 0^{\prime}$ : The output frequency has reached the value in 4-11 Motor Speed Low Limit [RPM] or 4-13 Motor Speed High Limit [RPM].
Bit $10=$ " 1 ": The output frequency is within the defined limits.
Bit 11, No operation/in operation
Bit $11==^{\prime} 0^{\prime}$ : The motor is not running.
Bit $11=^{\prime} 1^{\prime}$ : The frequency converter has a start signal or the output frequency is greater than 0 Hz .
Bit 12, Drive OK/stopped, autostart
Bit $12=^{\prime} 0^{\prime}$ : There is no temporary over temperature on the inverter.
Bit $12==^{\prime} 1$ : The inverter stops because of over temperature but the unit does not trip and resumes operation once the over temperature stops.

## Bit 13, Voltage OK/limit exceeded

Bit $13==^{\prime} 0^{\prime}$ : There are no voltage warnings.
Bit $13=^{\prime} 1$ ': The DC voltage in the intermediate circuit is too low or too high.

## Bit 14, Torque OK/limit exceeded

Bit $14=^{\prime} 0^{\prime}$ : The motor current is lower than the torque limit selected in 4-18 Current Limit.
Bit $14=^{\prime} 1$ ': The torque limit in $4-18$ Current Limit is exceeded.

## Bit 15, Timer OK/limit exceeded

Bit $15=^{\prime} 0^{\prime}$ : The timers for motor thermal protection and thermal protection are not exceeded $100 \%$.
Bit $15==^{\prime} 1$ : One of the timers exceeds $100 \%$.
If the connection between the Interbus option and the frequency converter is lost, or an internal communication problem has occurred, all bits in the STW are set to ' 0 .'

### 7.11.3 Bus Speed Reference Value

Speed reference value is transmitted to the frequency converter in a relative value in $\%$. The value is transmitted in the form of a 16-bit word; in integers ( $0-32767$ ) the value 16384 ( 4000 Hex ) corresponds to $100 \%$. Negative figures are formatted with 2's complement. The Actual Output frequency (MAV) is scaled in the same way as the bus reference.

Illustration 7.18 Bus Speed Reference Value

The reference and MAV are scaled as showed in Illustration 7.19.

Table 8.3 Technical Specifications, F1-F4, Mains Supply 3x380-480 V AC

1) For type of fuse, consult the Operating Instructions.
2) American Wire Gauge.
3) The typical power loss is at normal conditions and expected to be within $\pm 15 \%$ (tolerance relates to variety in voltage and cable conditions.) These values are based on a typical motor efficiency (IE2/IE3 border line). Lower efficiency motors add to the power loss in the frequency converter and the opposite is also true. If the switching frequency is raised from nominal, the power losses rise significantly. LCP and typical control card power consumptions are included. Further options and customer load can add up to 30 W to the losses (though typically only 4 W extra for a fully loaded control card or options for slot $A$ or slot $B$, each).
4) Measured using 5 m screened motor cables at rated load and rated frequency.
5) Wiring terminals on N132, N160, and N315 frequency converters cannot receive cables one size larger.

## Table 8.9 Technical Specifications, F2/F4, Mains Supply 3x525-690 V AC

1) For type of fuse, consult the Operating Instructions.
2) American Wire Gauge.
3) The typical power loss is at normal conditions and expected to be within $\pm 15 \%$ (tolerance relates to variety in voltage and cable conditions.) These values are based on a typical motor efficiency (IE2/IE3 border line). Lower efficiency motors add to the power loss in the frequency converter and the opposite is also true. If the switching frequency is raised from nominal, the power losses rise significantly. LCP and typical control card power consumptions are included. Further options and customer load can add up to 30 W to the losses (though typically only 4 W extra for a fully loaded control card or options for slot A or slot B, each).
4) Measured using 5 m screened motor cables at rated load and rated frequency.

## Table 8.15 Technical Specifications F12/F13 12-Pulse, Mains Supply 6x525-690 V AC

1) For type of fuse, consult the Operating Instructions
2) American Wire Gauge
3) The typical power loss is at normal conditions and expected to be within $\pm 15 \%$ (tolerance relates to variety in voltage and cable conditions.) These values are based on a typical motor efficiency (eff2/eff3 border line). Lower efficiency motors add to the power loss in the frequency converter and the opposite is also true. If the switching frequency is raised from nominal, the power losses rise significantly. LCP and typical control card power consumptions are included. Further options and customer load can add up to 30 W to the losses (though typically only 4 W extra for a fully loaded control card or options for slot $A$ or slot $B$, each)
4) Measured using 5 m screened motor cables at rated load and rated frequency

## Protection and Features

- Electronic thermal motor protection against overload.
- Temperature monitoring of the heatsink ensures that the frequency converter trips when the temperature reaches $95^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$. An overload temperature cannot be reset until the temperature of the heatsink is below $70^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ (Guideline - these temperatures vary for different power sizes and enclosures). The frequency converter has an auto derating function to prevent its heatsink reaching $95^{\circ} \mathrm{C}$.
- The frequency converter is protected against short-circuits on motor terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}$.
- If a mains phase is missing, the frequency converter trips or issues a warning (depending on the load).
- Monitoring of the intermediate circuit voltage ensures that the frequency converter trips if the intermediate circuit voltage is too low or high.
- The frequency converter is protected against ground faults on motor terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}$.

## ACAUTION

Connection to PC is carried out via a standard host/ device USB cable.
The USB connection is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals. The USB connection is not galvanically isolated from protection ground. Use only an isolated laptop/PC as connection to the USB connector on the frequency converter or an isolated USB cable/converter.

### 8.2 Efficiency

Efficiency of the Frequency Converter ( $\eta_{\text {vLT }}$ )
The load on the frequency converter has little effect on its efficiency. In general, the efficiency is the same at the rated motor frequency $f_{M, N}$, whether the motor supplies $100 \%$ of the rated shaft torque or only $75 \%$, in case of partial loads.
The efficiency of the frequency converter does not change even if other U/f characteristics are chosen. However, the U/f characteristics influence the efficiency of the motor.

The efficiency declines slightly when the switching frequency is set to a value of above 5 kHz . The efficiency is slightly reduced when the mains voltage is 480 V , or if the motor cable is longer than 30 m .

## Frequency Converter Efficiency Calculation

Calculate the efficiency of the frequency converter at different speeds and loads based on Illustration 8.2. The factor in this graph must be multiplied with the specific efficiency factor listed in the specification tables in chapter 8.1.1 Mains Supply 3x380-480 V AC and chapter 8.1.2 Mains Supply 3x525-690 V AC.

Illustration 8.2 Typical Efficiency Curves

Example: Assume a $160 \mathrm{~kW}, 380-480 \mathrm{~V}$ AC frequency converter at $25 \%$ load at $50 \%$ speed. Illustration 8.2 shows 0.97 - rated efficiency for a 160 kW frequency converter is 0.98 . The actual efficiency is then: $0.97 \times 0.98=0.95$.

## Efficiency of the Motor ( $\boldsymbol{\eta}$ мотов)

The efficiency of a motor connected to the frequency converter depends on magnetizing level. In general, the efficiency is as good as with mains operation. The efficiency of the motor depends on the type of motor.

In the range of $75-100 \%$ of the rated torque, the efficiency of the motor is practically constant, both when the frequency converter controls it and when it runs directly on mains.

In small motors, the influence from the U/f characteristic on efficiency is marginal. However, in motors from 11 kW and up, the advantages are significant.

In general, the switching frequency does not affect the efficiency of small motors. Motors from 11 kW and up have their efficiency improved (1-2\%) because the shape of the motor current sine wave is almost perfect at high switching frequency.
Efficiency of the System ( $\eta_{\text {SYSTEM }}$ )
To calculate system efficiency, the efficiency of the frequency converter ( $\eta_{V L T}$ ) is multiplied by the efficiency of the motor ( $\eta_{\text {мотов }}$ ):
$\eta_{\text {SYSTEM }}=\eta_{\text {VLT }} \times \eta_{\text {MOTOR }}$

### 8.3 Acoustic Noise

The acoustic noise from the frequency converter comes from three sources:

1. DC intermediate circuit coils.
2. Integral fan.
3. RFI filter choke.

### 8.4 Peak Voltage on Motor

When a transistor in the inverter bridge switches, the voltage across the motor increases by a dU/dt ratio depending on:

- the motor cable (type, cross-section, length screened or unscreened)
- inductance

The natural induction causes an overshoot UPEAK in the motor voltage before it stabilises itself at a level

General Specifications and ...
depending on the voltage in the intermediate circuit. The rise time and the peak voltage Upeak affect the service life of the motor. If the peak voltage is too high, especially motors without phase coil insulation are affected. If the motor cable is short (a few metres), the rise time and peak voltage are lower.
If the motor cable is long ( 100 m ), the rise time and peak voltage increases.

In motors without phase insulation paper or other insulation reinforcement suitable for operation with voltage supply (such as a frequency converter), fit a sinewave filter on the output of the frequency converter.

To obtain approximate values for cable lengths and voltages not mentioned here, use the following rules of thumb:

1. Rise time increases/decreases proportionally with cable length.
2. $\quad U_{\text {PEAK }}=\mathrm{DC}$ link voltage $\times 1.9$
$(D C$ link voltage $=$ Mains voltage $\times 1.35)$.
3. $d U / d t=\frac{0.8 \times U P E A K}{\text { Risetime }}$

Data are measured according to IEC 60034-17.
Cable lengths are in metres.

### 8.5 Special Conditions

### 8.5.1 Purpose of Derating

Consider derating when using the frequency converter at low air pressure (heights), at low speeds, with long motor cables, cables with a large cross section or at high ambient temperature. The required action is described in this section.

### 8.5.2 Derating for Low Air Pressure

The cooling capability of air is decreased at lower air pressure.

Below 1000 m altitude no derating is necessary but above 1000 m the ambient temperature ( $\mathrm{T}_{\mathrm{AMB}}$ ) or max. output current (lout) derate in accordance with

An alternative is to lower the ambient temperature at high altitudes and ensure $100 \%$ output current at high altitudes. As an example of how to read the graph, the situation at 2 km is elaborated. At a temperature of $45{ }^{\circ} \mathrm{C}$ (TAMB, MAX - 3.3 K ), $91 \%$ of the rated output current is available. At a temperature of $41.7^{\circ} \mathrm{C}, 100 \%$ of the rated output current is available.

Illustration 8.3 Derating of Output Current Versus Altitude at $\mathrm{T}_{\text {AMB, max }}$

Illustration 8.4 Derating of Output Current Versus Altitude at $\mathrm{T}_{\text {AMB, MAX }}$

### 8.5.3 Derating for Running at Low Speed

When a motor is connected to a frequency converter, it is necessary to check that the cooling of the motor is adequate.
The level of heating depends on the load on the motor, as well as the operating speed and time.

## Constant torque applications (CT mode)

In constant torque applications, it is possible for a motor to draw full current while operating at slow speeds. In such cases, the cooling fins do not adequately cool the motor, causing it to overheat. When the motor is operating continuously at less than half its rated speed, apply more cooling.

Alternately, an oversized motor can be used to reduce the load level. However, the size of the motor is limited to one size larger than that specified by the frequency converter.

An alternative is to reduce the load level of the motor by choosing a larger motor. However, the design of the frequency converter puts a limit to the motor size.

## Variable (Quadratic) torque applications (VT)

In VT applications such as centrifugal pumps and fans, where the torque is proportional to the square of the speed and the power is proportional to the cube of the speed, there is no need for more cooling or de-rating of the motor.

In the graphs shown below, the typical VT curve is below the maximum torque with de-rating and maximum torque with forced cooling at all speeds.

Illustration 8.5 Maximum Load for a Standard Motor at $40^{\circ} \mathrm{C}$

| ---- | Typical torque at VT load |
| :--- | :--- |
| $-\cdot-\cdot-$ | Max torque with forced cooling |
| - | Max torque |

Table 8.22 Legend to Illustration 8.5

## NOTICE

Over-synchronous speed operation results in the available motor torque decreasing inversely proportional with the increase in speed. Consider this decrease during the design phase to avoid overloading the motor.

### 8.5.4 Automatic Adaptations to Ensure Performance

The frequency converter constantly checks for critical levels of internal temperature, load current, high voltage on the intermediate circuit and low motor speeds. As a response to a critical level, the frequency converter can adjust the switching frequency and/or change the switching pattern in order to ensure the performance of the frequency converter. The capability to reduce the output current automatically extends the acceptable operating conditions even further.

### 8.6 Troubleshooting

A warning or alarm is signalled by the relevant LED on the front of the frequency converter and indicated by a code on the display.

A warning remains active until its cause is terminated. Under certain circumstances, operation of the motor may still continue. Warning messages are sometimes critical, but not always.

In the event of an alarm, the frequency converter trips. Reset alarms to restart operation once their cause has been rectified.

There are 4 ways to restart after an event:

1. Pressing [RESET] on the LCP.
2. Via a digital input with the "Reset" function.
3. Via serial communication/optional fieldbus.
4. By resetting automatically using the Auto Reset function, which is a default setting for VLT ${ }^{\circledR}$ HVAC Drive. See $14-20$ Reset Mode in the VLT ${ }^{\circledR}$ HVAC Basic Drive FC 102 Programming Guide

## NOTICE

After pressing [RESET], press the [Auto On] or [Hand On] button to restart the motor.

If an alarm cannot be reset, the reason may be that its cause has not been rectified, or the alarm is trip-locked (see also Table 8.25).

General Specifications and ...

## ACAUTION

Alarms that are trip-locked offer additional protection, meaning that the mains supply must be switched off before the alarm can be reset. After switching mains supply back on, the frequency converter is no longer blocked and may be reset as described above once the cause has been rectified.
Alarms that are not trip-locked can also be reset using the automatic reset function in 14-20 Reset Mode (Warning: automatic wake-up is possible)
If a warning and alarm is marked against a code in Table 8.25, this means that either a warning occurs before an alarm, or it can be specified whether it is a warning or an alarm that is to be displayed for a given fault.
This is possible, for instance, in 1-90 Motor Thermal Protection. After an alarm or trip, the motor carries on coasting, and the alarm and warning flash on the frequency converter. Once the problem has been rectified, only the alarm continues flashing.

## NOTICE

A trip is the action when an alarm has appeared. The trip will coast the motor and can be reset by pressing the reset button or making a reset by a digital input (parameter group 5-1* [1]). The original event that caused an alarm cannot damage the frequency converter or cause dangerous conditions. A trip lock is an action when an alarm occurs, which may cause damage to frequency converter or connected parts. A trip lock situation can only be reset by a power cycling.

Table 8.33 Extended Status Word 2

### 8.6.4 Warning and Alarm Introduction

The warning/alarm information below defines each warning/alarm condition, provides the probable cause for the condition, and details a remedy or troubleshooting procedure.

Test procedures are described in the service manual and should only be performed by qualified personnel.

## WARNING 1, 10 Volts low

The control card voltage is below 10 V from terminal 50. Remove some of the load from terminal 50 , as the 10 V supply is overloaded. Max. 15 mA or minimum $590 \Omega$.

This condition can be caused by a short in a connected potentiometer or improper wiring of the potentiometer.

## Troubleshooting

Remove the wiring from terminal 50 . If the warning clears, the problem is with the customer wiring. If the warning does not clear, replace the control card.

## WARNING/ALARM 2, Live zero error

This warning or alarm only appears if programmed by the user in 6-01 Live Zero Timeout Function. The signal on one of the analogue inputs is less than $50 \%$ of the minimum value programmed for that input. Broken wiring or faulty device sending the signal can cause this condition.

## Troubleshooting

Check connections on all the analog input terminals:

- Control card terminals 53 and 54 for signals, terminal 55 common.
- MCB 101 terminals 11 and 12 for signals, terminal 10 common.
- MCB 109 terminals 1, 3, 5 for signals, terminals $2,4,6$ common).
Check that the frequency converter programming and switch settings match the analog signal type.

Perform input terminal signal test.

## WARNING/ALARM 4, Mains phase loss

A phase is missing on the supply side, or the mains voltage imbalance is too high. This message also appears for a fault in the input rectifier on the frequency converter. Options are programmed at 14-12 Function at Mains Imbalance.

## Troubleshooting

Check the supply voltage and supply currents to the frequency converter.

## WARNING 5, DC link voltage high

The intermediate circuit voltage (DC) is higher than the high voltage warning limit. The limit is dependent on the frequency converter voltage rating. The unit is still active.

## WARNING 6, DC link voltage low

The intermediate circuit voltage (DC) is lower than the low voltage warning limit. The limit is dependent on the frequency converter voltage rating. The unit is still active.

## WARNING/ALARM 7, DC overvoltage

If the intermediate circuit voltage exceeds the limit, the frequency converter trips after a time.

## Troubleshooting

- Connect a brake resistor
- Extend the ramp time
- Change the ramp type
- Activate the functions in 2-10 Brake Function
- Increase 14-26 Trip Delay at Inverter Fault

## WARNING/ALARM 8, DC under voltage

If the intermediate circuit voltage ( DC link) drops below the under voltage limit, the frequency converter checks for a 24 V DC backup supply. If no 24 V DC backup supply is connected, the frequency converter trips after a fixed time delay. The time delay varies with unit size.

## Troubleshooting

- Check that the supply voltage matches the frequency converter voltage.
- Perform input voltage test.
- Perform soft charge circuit test.

## WARNING/ALARM 9, Inverter overload

The frequency converter is about to cut out because of an overload (too high current for too long). The counter for electronic, thermal inverter protection gives a warning at $98 \%$ and trips at $100 \%$, while giving an alarm. The frequency converter cannot be reset until the counter is below $90 \%$.
The fault is that the frequency converter is overloaded by more than $100 \%$ for too long.

## Troubleshooting

- Compare the output current on the LCP with the frequency converter rated current.
- Compare the output current on the LCP with measured motor current.
- Display the thermal drive load on the LCP and monitor the value. When running above the frequency converter continuous current rating, the counter increases. When running below the frequency converter continuous current rating, the counter decreases.

See chapter 8.5 Special Conditions for more details if a high switching frequency is required.
WARNING/ALARM 10, Motor overload temperature According to the electronic thermal protection (ETR), the motor is too hot. Select whether the frequency converter gives a warning or an alarm when the counter reaches $100 \%$ in 1-90 Motor Thermal Protection. The fault occurs
when the motor is overloaded by more than $100 \%$ for too long.

## Troubleshooting

- Check for motor overheating.
- Check if the motor is mechanically overloaded.
- Check that the motor current set in 1-24 Motor Current is correct.
- Ensure that motor data in parameters 1-20 through 1-25 are set correctly.
- If an external fan is in use, check in 1-91 Motor External Fan that it is selected.
- Run AMA in 1-29 Automatic Motor Adaptation (AMA) tune the frequency converter to the motor more accurately and reduce thermal loading.

## WARNING/ALARM 11, Motor thermistor overtemp

The thermistor might be disconnected. Select whether the frequency converter gives a warning or an alarm in 1-90 Motor Thermal Protection.

## Troubleshooting

- Check for motor overheating.
- Check if the motor is mechanically overloaded.
- When using terminal 53 or 54 , check that the thermistor is connected correctly between either terminal 53 or 54 (analogue voltage input) and terminal 50 ( +10 V supply) and that the terminal switch for 53 or 54 is set for voltage. Check that 1-93 Thermistor Source selects terminal 53 or 54.
- When using digital inputs 18 or 19 , check that the thermistor is connected correctly between either terminal 18 or 19 (digital input PNP only) and terminal 50. Check 1-93 Thermistor Source selects terminal 18 or 19.

## WARNING/ALARM 12, Torque limit

The torque has exceeded the value in 4-16 Torque Limit Motor Mode or the value in 4-17 Torque Limit Generator Mode. 14-25 Trip Delay at Torque Limit can change this from a warning only condition to a warning followed by an alarm.

## Troubleshooting

- If the motor torque limit is exceeded during ramp up, extend the ramp up time.
- If the generator torque limit is exceeded during ramp down, extend the ramp down time.
- If torque limit occurs while running, possibly increase the torque limit. Be sure the system can operate safely at a higher torque.
- Check the application for excessive current draw on the motor.

## WARNING/ALARM 13, Over current

The inverter peak current limit (approximately 200\% of the rated current) is exceeded. The warning lasts about 1.5 s , then the frequency converter trips and issues an alarm. This fault may be caused by shock loading or fast acceleration with high inertia loads. If extended mechanical brake control is selected, trip can be reset externally.

## Troubleshooting

- Remove power and check if the motor shaft can be turned.
- Check that the motor size matches the frequency converter.
- Check parameters 1-20 through 1-25 for correct motor data.

## ALARM 14, Earth (ground) fault

There is current from the output phases to earth, either in the cable between the frequency converter and the motor or in the motor itself.

## Troubleshooting

- Remove power to the frequency converter and repair the earth fault.
- Check for earth faults in the motor by measuring the resistance to ground of the motor leads and the motor with a megohmmeter.

## ALARM 15, Hardware mismatch

A fitted option is not operational with the present control board hardware or software.

Record the value of the following parameters and contact Danfoss.

- $\quad 15-40$ FC Type
- 15-41 Power Section
- 15-42 Voltage
- 15-43 Software Version
- 15-45 Actual Typecode String
- 15-49 SW ID Control Card
- 15-50 SW ID Power Card
- 15-60 Option Mounted
- 15-61 Option SW Version (for each option slot)

## ALARM 16, Short circuit

There is short-circuiting in the motor or motor wiring.
Remove power to the frequency converter and repair the short circuit.

## WARNING/ALARM 17, Control word timeout

There is no communication to the frequency converter. The warning is only active when 8-04 Control Timeout Function is not set to OFF. If 8 -04 Control Timeout Function is set to Stop and Trip, a warning appears and the frequency converter ramps down until it stops then displays an alarm.

General Specifications and ...

## Troubleshooting

- Check connections on the serial communication cable.
- Increase 8-03 Control Timeout Time
- Check the operation of the communication equipment.
- Verify a proper installation based on EMC requirements.

## ALARM 18, Start failed

The speed has not exceeded 1-77 Compressor Start Max Speed [RPM] during start within the allowed time. (set in 1-79 Pump Start Max Time to Trip). This may be caused by a blocked motor.

## WARNING 23, Internal fan fault

The fan warning function is an extra protective function that checks if the fan is running/mounted. The fan warning can be disabled in 14-53 Fan Monitor ([0] Disabled).
For the D, E, and F Frame units, the regulated voltage to the fans is monitored.

## Troubleshooting

- Check for proper fan operation.
- Cycle power to the frequency converter and check that the fan operates briefly at start up.
- Check the sensors on the heatsink and control card.

## WARNING 24, External fan fault

The fan warning function is an extra protective function that checks if the fan is running/mounted. The fan warning can be disabled in 14-53 Fan Monitor ([0] Disabled).

## Troubleshooting

- Check for proper fan operation.
- Cycle power to the frequency converter and check that the fan operates briefly at start up.
- Check the sensors on the heatsink and control card.

## WARNING 25, Brake resistor short circuit

The brake resistor is monitored during operation. If a short circuit occurs, the brake function is disabled and the warning appears. The frequency converter is still operational but without the brake function. Remove power to the frequency converter and replace the brake resistor (see 2-15 Brake Check).

## WARNING/ALARM 26, Brake resistor power limit

The power transmitted to the brake resistor is calculated as a mean value over the last 120 s of run time. The calculation is based on the intermediate circuit voltage and the brake resistance value set in 2-16 AC brake Max. Current. The warning is active when the dissipated braking is higher than $90 \%$ of the brake resistance power. If [2] Trip is selected in 2-13 Brake Power Monitoring, the frequency converter trips when the dissipated braking power reaches $100 \%$.

## WARNING/ALARM 27, Brake chopper fault

The brake transistor is monitored during operation and if a short circuit occurs, the brake function is disabled and a warning is issued. The frequency converter is still operational but, since the brake transistor has shortcircuited, substantial power is transmitted to the brake resistor, even if it is inactive.
Remove power to the frequency converter and remove the brake resistor.

## WARNING/ALARM 28, Brake check failed

The brake resistor is not connected or not working. Check 2-15 Brake Check.

## ALARM 29, Heat Sink temp

The maximum temperature of the heatsink has been exceeded. The temperature fault does not reset until the temperature falls below a defined heatsink temperature. The trip and reset points are different based on the frequency converter power size.

## Troubleshooting

Check for the following conditions.

- Ambient temperature too high.
- Motor cable too long.
- Incorrect airflow clearance above and below the frequency converter.
- Blocked airflow around the frequency converter.
- Damaged heatsink fan.
- Dirty heatsink.

## ALARM 30, Motor phase U missing

Motor phase $U$ between the frequency converter and the motor is missing.

Remove power from the frequency converter and check motor phase U.

## ALARM 31, Motor phase V missing

Motor phase V between the frequency converter and the motor is missing.
Remove power from the frequency converter and check motor phase V.

## ALARM 32, Motor phase W missing

Motor phase W between the frequency converter and the motor is missing.

Remove power from the frequency converter and check motor phase W.

## ALARM 33, Inrush fault

Too many power-ups have occurred within a short time period. Let the unit cool to operating temperature.
WARNING/ALARM 34, Fieldbus communication fault The fieldbus on the communication option card is not working.

General Specifications and ...

## WARNING/ALARM 36, Mains failure

This warning/alarm is only active if the supply voltage to the frequency converter is lost and 14-10 Mains Failure is not set to [0] No Function. Check the fuses to the frequency converter and mains power supply to the unit.

## ALARM 38, Internal fault

When an internal fault occurs, a code number defined in Table 8.34 is displayed.

## Troubleshooting

- Cycle power
- Check that the option is properly installed
- Check for loose or missing wiring

If necessary, contact the Danfoss supplier or service department. Note the code number for further troubleshooting directions.

Table 8.34 Internal Fault Codes

## ALARM 39, Heat sink sensor

No feedback from the heatsink temperature sensor.

The signal from the IGBT thermal sensor is not available on the power card. The problem could be on the power card, gate drive card, or ribbon cable between the power card and gate drive card.

## WARNING 40, Overload of digital output terminal 27

Check the load connected to terminal 27 or remove shortcircuit connection. Check 5-00 Digital I/O Mode and 5-01 Terminal 27 Mode.

## WARNING 41, Overload of digital output terminal 29

Check the load connected to terminal 29 or remove shortcircuit connection. Check 5-00 Digital I/O Mode and 5-02 Terminal 29 Mode.

## WARNING 42, Overload of digital output on X30/6 or overload of digital output on X30/7

For X30/6, check the load connected to X30/6 or remove the short-circuit connection. Check 5-32 Term X30/6 Digi Out (MCB 101).

For X30/7, check the load connected to X30/7 or remove the short-circuit connection. Check 5-33 Term X30/7 Digi Out (MCB 101).

## ALARM 45, Earth fault 2

Earth (ground) fault on start up.

## Troubleshooting

- Check for proper earthing (grounding) and loose connections.
- Check for proper wire size.
- Check motor cables for short-circuits or leakage currents.

## ALARM 46, Power card supply

The supply on the power card is out of range.
There are 3 power supplies generated by the switch mode power supply (SMPS) on the power card: $24 \mathrm{~V}, 5 \mathrm{~V},+/-18$ V. When powered with 24 V DC with the MCB 107 option, only the 24 V and 5 V supplies are monitored. When powered with three phase mains voltage, all 3 supplies are monitored.

## Troubleshooting

- Check for a defective power card.
- Check for a defective control card.
- Check for a defective option card.
- If a 24 V DC power supply is used, verify proper supply power.

## WARNING 47, 24 V supply low

The 24 V DC is measured on the control card. The external 24 V DC backup power supply may be overloaded. If not contact Danfoss.

## WARNING 48, 1.8 V supply low

The 1.8 V DC supply used on the control card is outside of allowable limits. The power supply is measured on the control card. Check for a defective control card. If an option card is present, check for an overvoltage condition.

General Specifications and ...

## WARNING 49, Speed limit

When the speed is not within the specified range in 4-11 Motor Speed Low Limit [RPM] and 4-13 Motor Speed High Limit [RPM], the frequency converter shows a warning. When the speed is below the specified limit in 1-86 Trip Speed Low [RPM] (except when starting or stopping) the frequency converter trips.

## ALARM 50, AMA calibration failed

Contact the Danfoss supplier or service department.
ALARM 51, AMA check $U_{\text {nom }}$ and $I_{\text {nom }}$
The settings for motor voltage, motor current, and motor power are wrong. Check the settings in parameters 1-20 to 1-25.

ALARM 52, AMA low Inom
The motor current is too low. Check the settings.
ALARM 53, AMA motor too big
The motor is too big for the AMA to operate.

## ALARM 54, AMA motor too small

The motor is too small for the AMA to operate.
ALARM 55, AMA Parameter out of range
The parameter values of the motor are outside of the acceptable range. AMA will not run.
ALARM 56, AMA interrupted by user
The user has interrupted the AMA.
ALARM 57, AMA internal fault
Try to restart AMA again. Repeated restarts may over heat the motor.

## ALARM 58, AMA internal fault

Contact your Danfoss supplier.

## WARNING 59, Current limit

The current is higher than the value in 4-18 Current Limit. Ensure that motor data in parameters 1-20 through 1-25 are set correctly. Increase the current limit, if necessary. Be sure that the system can operate safely at a higher limit.

## WARNING 60, External interlock

A digital input signal indicates a fault condition external to the frequency converter. An external interlock has commanded the frequency converter to trip. Clear the external fault condition. To resume normal operation, apply 24 V DC to the terminal programmed for external interlock. Reset the frequency converter.

WARNING 62, Output frequency at maximum limit The output frequency has reached the value set in 4-19 Max Output Frequency. Check the application to determine the cause. Possibly increase the output frequency limit. Be sure the system can operate safely at a higher output frequency. The warning clears when the output drops below the maximum limit.

WARNING/ALARM 65, Control card over temperature The cutout temperature of the control card is $80^{\circ} \mathrm{C}$.

## Troubleshooting

- Check that the ambient operating temperature is within limits
- Check for clogged filters
- Check fan operation
- Check the control card

## WARNING 66, Heat sink temperature low

The frequency converter is too cold to operate. This warning is based on the temperature sensor in the IGBT module.
Increase the ambient temperature of the unit. A trickle amount of current can be supplied to the frequency converter whenever the motor is stopped by setting 2-00 DC Hold/Preheat Current at 5\% and 1-80 Function at Stop.

ALARM 67, Option module configuration has changed One or more options have either been added or removed since the last power-down. Check that the configuration change is intentional and reset the unit.

## ALARM 68, Safe Stop activated

Loss of the 24 V DC signal on terminal 37 has caused the unit to trip. To resume normal operation, apply 24 V DC to terminal 37 and reset the unit.

## ALARM 69, Power card temperature

The temperature sensor on the power card is either too hot or too cold.

## Troubleshooting

- Check that the ambient operating temperature is within limits.
- Check for clogged filters.
- Check fan operation.
- Check the power card.

## ALARM 70, Illegal frequency converter configuration

The control card and power card are incompatible. Contact the supplier with the type code of the unit from the nameplate and the part numbers of the cards to check compatibility.

## ALARM 71, PTC 1 safe torque off

Safe torque off has been activated from the MCB 112 PTC thermistor card (motor too warm). Normal operation can resume when the MCB 112 applies 24 V DC to T-37 again (when the motor temperature reaches an acceptable level) and when the digital input from the MCB 112 is deactivated. When that happens, a reset signal is sent (via Bus, Digital I/O, or by pressing [RESET]).

## ALARM 72, Dangerous failure

Safe torque off with trip lock. The dangerous failure alarm is issued if the combination of safe torque off commands is unexpected. This occurs if the MCB 112 VLT PTC Thermistor Card enables $\mathrm{X} 44 / 10$ but safe torque off is not enabled. Furthermore, if the MCB 112 is the only device using safe torque off (specified through selection [4] or [5]

General Specifications and ...
in 5-19 Terminal 37 Digital Input), an unexpected combination is activation of safe torque off without the X44/10 being activated. Table 8.34 summarizes the unexpected combinations that lead to Alarm 72. Note that if $X 44 / 10$ is activated in selection 2 or 3 , this signal is ignored. However, the MCB 112 is still able to activate safe torque off.

## ALARM 80, Drive initialised to default value

Parameter settings are initialised to default settings after a manual reset. Reset the unit to clear the alarm.

## ALARM 92, No flow

A no-flow condition has occurred. 22-23 No-Flow Function is set for alarm. Troubleshoot the system and reset the frequency converter after the fault has been cleared.

## ALARM 93, Dry pump

A no-flow condition in the system with the frequency converter operating at high speed may indicate a dry pump. 22-26 Dry Pump Function is set for alarm.
Troubleshoot the system and reset the frequency converter after clearing the fault.

## ALARM 94, End of curve

Feedback is lower than the set point. This may indicate leakage in the system. 22-50 End of Curve Function is set for alarm. Troubleshoot the system and reset the frequency converter after the fault has been cleared.

## ALARM 95, Broken belt

Torque is below the torque level set for no load, indicating a broken belt. 22-60 Broken Belt Function is set for alarm.
Troubleshoot the system and reset the frequency converter after the fault has been cleared.

## ALARM 96, Start delayed

Motor start has been delayed due to short-cycle protection. 22-76 Interval between Starts is enabled.
Troubleshoot the system and reset the frequency converter after the fault has been cleared.

## WARNING 97, Stop delayed

Stopping the motor has been delayed due to short cycle protection. 22-76 Interval between Starts is enabled.
Troubleshoot the system and reset the frequency converter after the fault has been cleared.

## WARNING 98, Clock fault

Time is not set or the RTC clock has failed. Reset the clock in 0-70 Date and Time.

## WARNING/ALARM 104, Mixing fan fault

The fan monitor checks that the fan is spinning at drive power-up or whenever the mixing fan is turned on. If the fan is not operating, then the fault is annunciated. The mixing-fan fault can be configured as a warning or an alarm trip by 14-53 Fan Monitor.

## Troubleshooting

Cycle power to the frequency converter to determine if the warning/alarm returns.

## WARNING 200, Fire mode

This indicates the frequency converter is operating in fire mode. The warning clears when fire mode is removed. See the fire mode data in the alarm log.

## WARNING 201, Fire mode was active

This indicates the frequency converter had entered fire mode. Cycle power to the unit to remove the warning. See the fire mode data in the alarm log.

## WARNING 202, Fire mode limits exceeded

While operating in fire mode one or more alarm conditions have been ignored which would normally trip the unit. Operating in this condition voids unit warranty. Cycle power to the unit to remove the warning. See the fire mode data in the alarm log.

WARNING 203, Missing motor
With a frequency converter operating multi-motors, an under-load condition was detected. This could indicate a missing motor. Inspect the system for proper operation.

WARNING 204, Locked rotor
With a frequency converter operating multi-motors, an overload condition was detected. This could indicate a locked rotor. Inspect the motor for proper operation.

## WARNING 250, New spare part

A component in the frequency converter has been replaced. Reset the frequency converter for normal operation.

## WARNING 251, New typecode

The power card or other components have been replaced and the typecode changed. Reset to remove the warning and resume normal operation.
